Slider type (Ball bushing bearing)	REAL	P. 965
Linear guide type (Single axis)	REAH	P. 979
Linear guide type (Double axis)	REAHT	P. 979

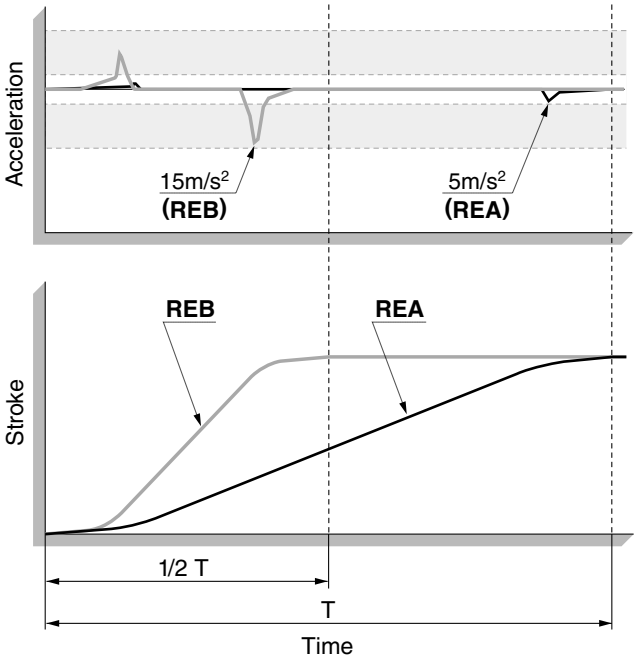
Series REB (600 mm/s)

Guide type	Model	Page
Direct mount type	REBR	P. 995
Linear guide type (Single axis)	REBH	P. 1007
Linear guide type (Double axis)	REBHT	P. 1007

Allows rapid transfer of impact

Throughput dramatically increased (Maximum speed: **600** mm/s)

Series REB introduced with a maximum speed of 600 mm/s. Compared with the previous type (Series REA: 300 mm/s), the tact time can be shortened by approximately 1/2.



Smooth acceleration & deceleration at 5

Cushion ring

The exterior of the cushion ring is provided with a variable throttle groove in its longitudinal direction.

Acceleration ranges

Model Selection Criteria

Model Selection Criteria	Recommended Cylinder			
	Appearance		Features	
• When many different types of guides are used • When a long stroke is necessary	Guide non-integrated type	**Series REA** **Size: ø25, ø32, ø40, ø50, ø63** 	• Wide variations from ø25 to ø63.	• Long strokes available.
• When many different types of guides are used • When auto switches are added to the basic style • When used without a guide for a light load • When space is very limited	Guide non-integrated type	**Series REAR** **Size: ø10, ø15, ø20, ø25, ø32, ø40** **Series REBR** **Size: ø15, ø25, ø32** 	• Choice of the maximum speed of 300 mm/s or 600 mm/s is available.	• Cylinder can be directly mounted. • Auto switch capable, with no cylinder lurching. • Rotation can be stopped within an allowable range. • Compact external dimensions • Mounting can be performed from the top or one side.
• To ensure a permanent path • When used for general transfer operations	Guide integrated type	**Series REAS** **Size: ø10, ø15, ø20, ø25, ø32, ø40** 	• A load can be carried directly by the guide integrated type. • The centralized piping type allows concentration of piping on one side plate. • Auto switch capable. • Choice of the maximum speed of 300 mm/s or 600 mm/s is available. (RE□H/Linear guide type)	• Smooth operation is made possible by using special slide bearings.
• To ensure a permanent path • When smoother operation is required, even with an offset load	Guide integrated type	**Series REAL** **Size: ø10, ø15, ø20, ø25, ø32, ø40** 		• Stable operation is possible, even with an offset load, by using ball bushings.
• To ensure a permanent path • When a large load, large moment is required • When used for pick-and-place operations, etc.	Guide integrated type	**Series REAH** **Size: ø10, ø15, ø20, ø25, ø32** **Series REBH** **Size: ø15, ø25, ø32** 		• The use of a linear guide facilitates a large load, large moment. • Mounting freedom is improved by providing T-slots on the mounting surfaces. • A top cover mounted over the sliding parts of the cylinder prevents scratches and damage, etc.

Series REA/REB
Specific Product Precautions

Be sure to read before handling. Refer to front matters 42 and 43 for Safety Instructions and pages 3 to 11 for Actuator and Auto Switch Precautions.

Disassembly and Maintenance

⚠ Warning

1. Use caution as the attractive force of the magnets is very strong.

When removing the external slider and piston slider from the cylinder tube for maintenance, etc., handle with caution, since the magnets installed in each slider have a very strong attractive force.

⚠ Caution

1. Use caution when removing the external slider, as the piston slider will be directly attracted to it.

When removing the external slider or piston slider from the cylinder tube, first force the sliders out of their magnetically coupled positions, and then remove them individually when there is no longer any holding force. If they are removed while still magnetically coupled, they will be directly attracted to one another and will not come apart.

2. Do not disassemble the magnetic components (piston slider, external slider).

This can cause a loss of holding force and malfunction.

3. When disassembling to replace the seals and wear ring, refer to the separate disassembly instructions.

4. Use caution to the direction of the external slider and the piston slider.

Since the external slider and piston slider are directional for size ø10, refer to the figures below when performing disassembly or maintenance. Put the external slider and piston slider together, and insert the piston slider into the cylinder tube so that they will have the correct positional relationship as shown in Fig. (1). If they align as shown in Fig. (2), reinsert the piston slider only, after turning it around 180°. If the direction is not correct, it will be impossible to obtain the specified holding force.

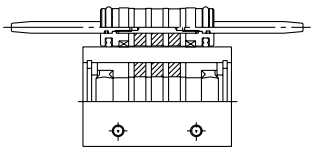

Fig. (1) Correct position

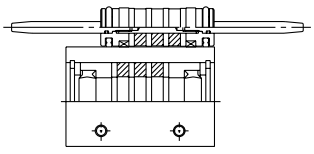

Fig. (2) Incorrect position

5. During disassembly, use caution in handling the cushion ring.

The cushion ring is a precision part, and any deformation, etc., can cause malfunction or poor performance.

Speed Adjustment

⚠ Caution

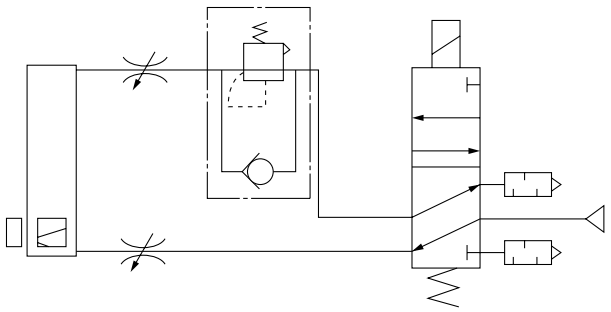
1. SMC's "throttle" type speed controllers (Series AS) are recommended for speed adjustment. (Refer to Table (3).)

Table (3) Recommended Speed Controller

Bore size (mm)	Model		
	Elbow type	Straight type	In-line type
10	AS1201F-M5-04-X214	AS1301F-M5-04-X214	AS1001F-04-X214
15	AS1201F-M5-04-X214	AS1301F-M5-04-X214	AS1001F-04-X214
20	AS2201F-01-06-X214	AS2301F-01-06-X214	AS2001F-06-X214
25	AS2201F-01-06-X214	AS2301F-01-06-X214	AS2001F-06-X214
32	AS2201F-01-06-X214	AS2301F-01-06-X214	AS2001F-06-X214
40	AS2201F-02-06-X214	AS2301F-02-06-X214	AS2001F-06-X214
50	AS3201F-02-08-X214	AS3301F-02-08-X214	AS3001F-08-X214
63	AS3201F-02-08-X214	AS3301F-02-08-X214	AS3001F-08-X214

2. Speed adjustment is possible with meter-in/meter-out type speed controllers, but it may not be possible to obtain the cushion effect (smooth start-up, soft stop).

3. In the case of other than horizontal mounting, it is recommended that the system have a reduced pressure supply circuit installed at its lower side. (This is also effective as a countermeasure against start-up delay on an upward stroke, and for air conservation.)



Lower-side reduced pressure supply circuit

Adjustment of Cushion Effect (Smooth start-up, Soft stop)

⚠ Caution

1. The cushion cannot be adjusted.

There is no cushion needle adjustment of the kind found on conventional cushion mechanisms.

Basic Type

Series REA

ø25, ø32, ø40, ø50, ø63

Model Selection 1

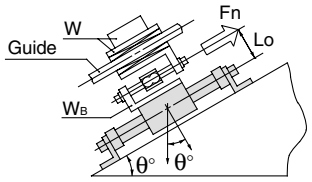
Fn: Allowable driving force (N)
Pv: Maximum operating pressure for vertical operation (MPa)
WBmax: Maximum connection fitting mass (kg)
Wv: Allowable load mass for vertical operation (kg)

Operating Conditions

- W: Load mass (kg)
- WB: Connection fitting mass (kg)
- μ: Guide's coefficient of friction
- Lo: Distance from cylinder shaft center to workpiece point of application (cm)
- Mode of operation (horizontal, inclined, vertical)
- P: Operating pressure (MPa)
- U: Maximum speed (mm/s)
- Stroke (mm)

Mode of operation

- **Horizontal operation** → **First tentative bore size determination** $\varnothing D \geq 1.6 \times \sqrt{\frac{F_1}{P}}$
- **Inclined operation** → **First tentative bore size determination** $\varnothing D \geq 1.6 \times \sqrt{\frac{F_2}{P}}$
- **Vertical operation** → **First tentative bore size determination** $\varnothing D \geq 1.6 \times \sqrt{\frac{F_3}{P}}$



Inclined operation

Allowable Driving Force (Fn) (n = 1, 2, 3)

Horizontal	$F_1 = \mu \times (W + W_B) \times 9.8$
Inclined	$F_2 = (W + W_B) \times 9.8 \times (\mu\cos\theta + \sin\theta)$
Vertical	$F_3 = (W + W_B) \times 9.8 \times (\mu + 1)$

For the (Fn) of data (A), refer to the allowable driving force table.

Review of load mass and operating pressure

Determination of allowable load mass & pressure

- $W + W_B \leq W_V$, $P \leq P_V$ → (For vertical operation, refer to page 934.)
- $W + W_B > W_V$, $P > P_V$ → **Review of load mass and operating pressure**

Determination of connection fitting mass (W_B)

(For connection fitting mass, refer to page 934.)

- $W_B > W_{Bmax}$ → **Review of connection fitting**
- $W_B \leq W_{Bmax}$ → (Refer to data (A) on page 933.)

Second tentative determination of bore size using the graph of allowable driving force (Fn) and distance from cylinder shaft center (Lo)

(Refer to data (B) on page 933.)

Third tentative determination of bore size from the graph of maximum speed (U) and load mass (W).

(Bore size is the largest of 3 tentative determinations.)

Bore size determination

Note)

Consider made-to-order products, depending on an operating condition.

(Refer to page 935.)

Model selected

Note) Made-to-order products should be considered, too, depending on an operating environment, etc.

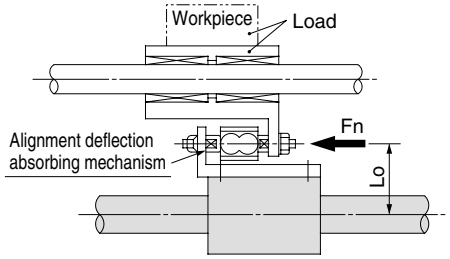
Model Selection 2

Caution on Design 1

Selection Method

Selection Procedures

1. Find the drive resisting force Fn (N) when moving the load horizontally.
2. Find the distance Lo (cm) from the point of the load where driving force is applied, to the center of the cylinder shaft.
3. Select a bore size from Lo and Fn in Data (A).



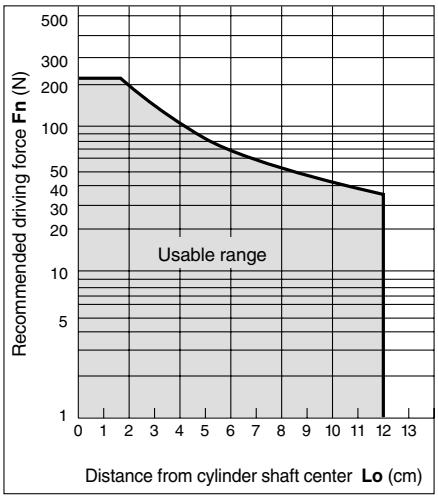
Selection Example

Given a load drive resisting force of Fn = 100 (N) and a distance from the cylinder shaft center to the load application point of Lo = 8 cm, find the intersection point by extending upward from the horizontal axis of data (A) where the distance from the shaft center is 8 cm, and then extending to the side, find the allowable driving force on the vertical axis. Models suitable to satisfy the requirement of 100 (N) are **REA32** or **REA40**.

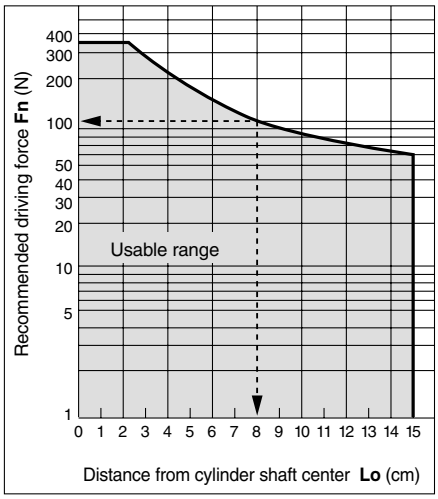
* Distance from cylinder shaft center, Lo, is the moment working point between the cylinder and the load.

<Data (A): Distance from Cylinder Shaft Center——Allowable Driving Capacity>

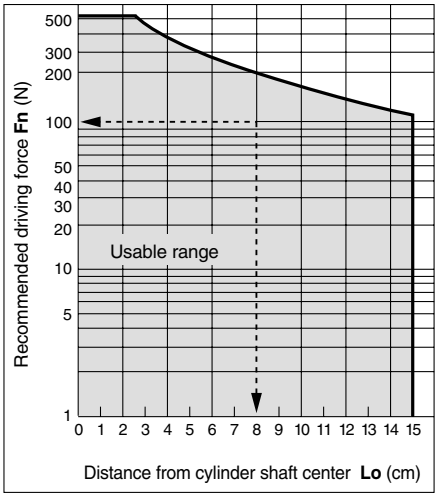
ø25



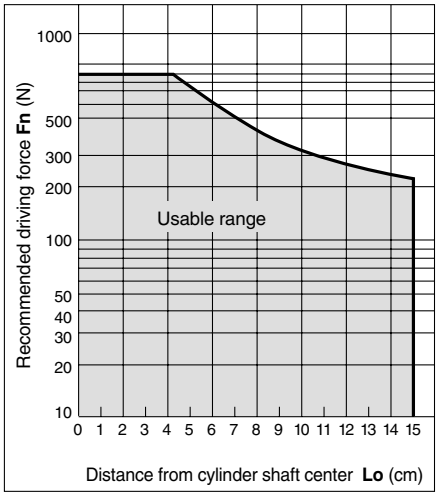
ø32



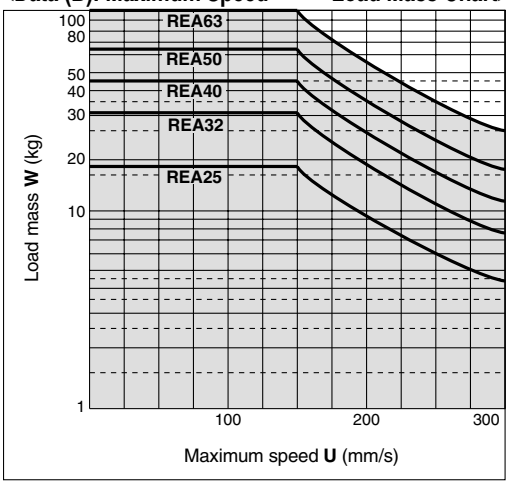
ø40



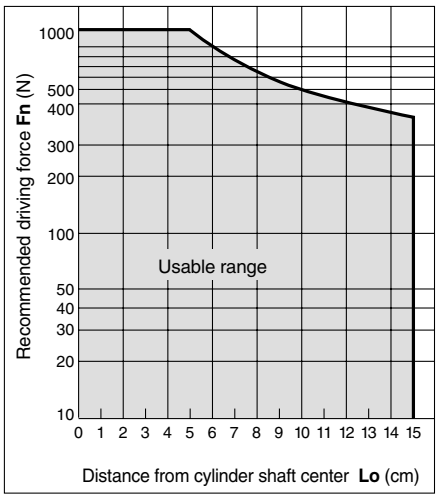
ø50



<Data (B): Maximum Speed——Load Mass Chart>



ø63

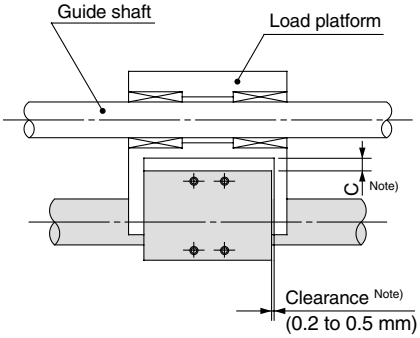


Model Selection 3

Caution on Design 2

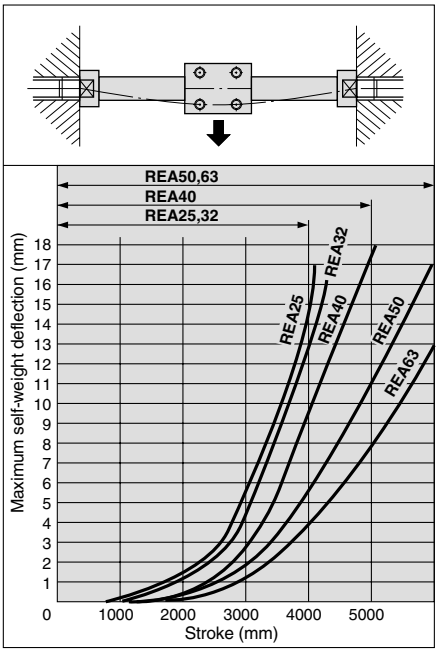
Cylinder Self-weight Deflection

When the cylinder is mounted horizontally, deflection appears due to its own weight as shown in the data, and the longer the stroke the greater the amount of variation in the shaft centers. A connection method as shown in the figure should be considered to allow for this deflection.



The above clearance is for reference.

Note) Referring to the self-weight deflection in the graph below, provide clearance so that the cylinder does not touch the mounting surface or the load section, and is able to operate smoothly within the minimum operating pressure range for a full stroke.



∗ The above deflection data indicate values for external movement within the stroke.

Max. Connection Fitting Mass

REA (Basic type) is not directly connected to the load, and is guided by another shaft (LM guide, etc.). Load connection fittings should be designed so that they do not exceed the mass given in the table below.

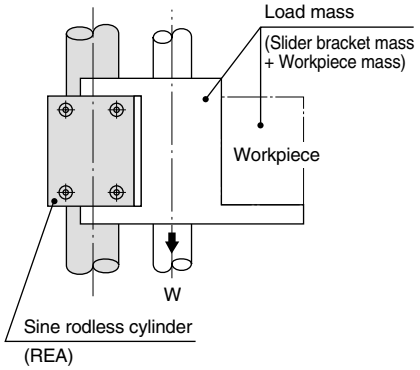
Maximum Connection Fitting Mass $W_B$max (kg)

Model	Maximum load (kg)
REA25	1.2
REA32	1.5
REA40	2.0
REA50	2.5
REA63	3.0

∗ When loading the mass exceeding the above values, please consult with SMC.

Vertical Operation

The load should be guided by a ball type bearing (Linear guide, etc.). If a slide bearing is used, sliding resistance increases due to the load mass and load moment, which can cause malfunction.
When the cylinder is mounted vertically or sidelong, sliders may move downwards due to the self-weight or workpiece mass. If an accurate stopping position is required at the stroke end or the middle-stroke, use an external stopper to secure accurate positioning.



Model	Allowable load mass **Wv** (kg)	Maximum operating pressure **Pv** (MPa)
REA25	18.5	0.65
REA32	30.0	0.65
REA40	47.0	0.65
REA50	75.0	0.65
REA63	115.0	0.65

Note) Use caution, since the magnetic coupling may be dislocated if it is used over the maximum operating pressure.

Intermediate Stop

The cushion effect (smooth start-up, soft stop) exists only before the stroke end in the stroke ranges indicated in the table below.
The cushion effect (smooth start-up, soft stop) cannot be obtained in an intermediate stop or a return from an intermediate stop using an external stopper, etc.

Cushion Stroke

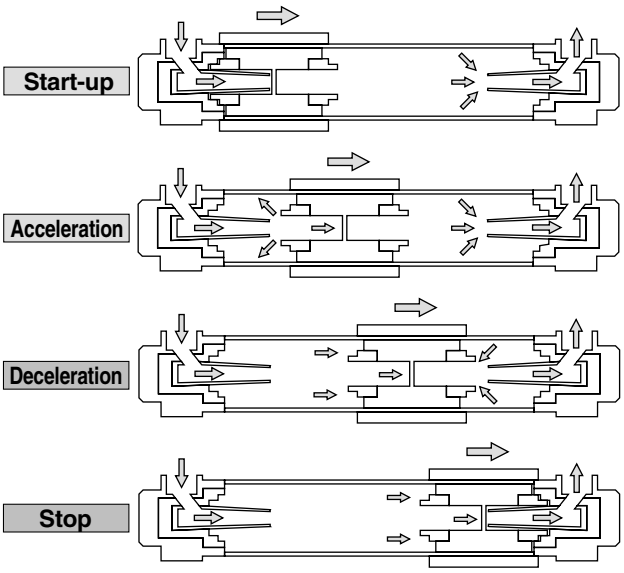
Working principle



Start-up/Acceleration

The driving air from the cylinder port passes through the inside of the cushion ring, and flows into the left chamber of the drive piston from the clearance between the cushion seal and the U-shaped groove in the outer surface of the cushion ring. Further, the exhaust air in the right chamber of the drive piston passes from inside the hollow cushion ring through the cylinder port and is released to the atmosphere by the drive solenoid valve.
When the differential pressure (thrust) generated on either side of the drive piston becomes larger than the starting resistance of the machinery, the drive piston begins to move to the right. As the drive piston moves to the right, the U-shaped groove in the outer surface of the cushion ring gradually becomes deeper, a flow corresponding to the drive speed of the drive piston flows into the left chamber of the drive piston, and the drive piston proceeds to accelerate. The U-shaped groove is machined into the cushion ring in such a way that this acceleration process can proceed smoothly (as a sine function).

Deceleration/Stop

In conventional cushion mechanisms, when the cushion seal installed on the drive piston is pushed into the cushion ring at the right stroke end, the drive piston's right chamber is pressurized and a sudden braking force is generated. However, in a sine rodless cylinder, due to the U-shaped groove provided on the outer surface of the cushion ring, whose depth changes as a sine function, a large quantity of the air in the cushion chamber is discharged when the cushion seal is pushed in, and a sudden braking force is not generated. With the progression of the cushion stroke, the discharge flow from the cushion chamber is restricted, and therefore, a soft stop is achieved at the stroke end.

Series REA
Specific Product Precautions

Be sure to read before handling. Refer to front matters 42 and 43 for Safety Instructions and pages 3 to 11 for Actuator and Auto Switch Precautions.

Mounting

⚠ Caution

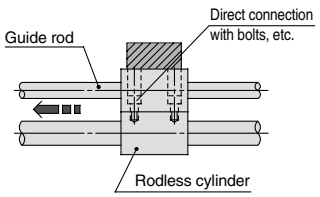
1. Take care to avoid nicks or other damage on the outside surface of the cylinder tube.
This can lead to a damage of the scraper and the wear ring, which in turn can cause malfunction.

2. Use caution to the rotation of the external slider.
Rotation should be controlled by connecting it to another shaft (linear guide, etc.).

3. Do not operate with the magnetic coupling out of position.
If the magnetic coupling is out of position, push the external slider by hand (or the piston slider with air pressure) back to the proper position at the stroke end.

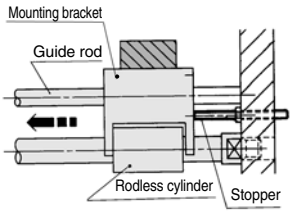
4. Be sure that both head covers are secured to the mounting surface before operating the cylinder.
Avoid operation with the external slider secured to the surface.

5. Do not apply a lateral load to the external slider.
When a load is mounted directly to the cylinder, variations in the alignment of each shaft center cannot be offset, which results in the generation of a lateral load that can cause malfunction. The cylinder should be operated using a connection method which allows for shaft alignment variations and deflection due to the cylinder's own mass. A drawing of a recommended mounting is shown in Fig. (2).



Variations in the load and cylinder shaft alignment cannot be offset and may result in a malfunction.

Fig. (1) Incorrect mounting



Shaft alignment variations are offset by providing clearance between the mounting bracket and cylinder.
Moreover, the mounting bracket is extended above the cylinder shaft center, so that the cylinder is not subjected to moment.

Fig. (2) Recommended mounting

6. Use caution regarding the allowable load mass when operating in a vertical direction.
The allowable load mass when operating in a vertical direction (reference values on page 934 is determined by the model selection method. However, if a load greater than the allowable value is applied, the magnetic coupling may break and there is a possibility of dropping the load. When using this type of application, please contact SMC regarding the operating conditions (pressure, load, speed).

Disassembly and Maintenance

⚠ Caution

1. When reattaching the head covers after disassembly, confirm that they are tightened securely.
When disassembling, hold the wrench flats of one head cover with a vise, and remove the other cover using a spanner or adjustable wrench on the wrench flats. When retightening, first coat with Loctite® (no. 542 Red), and retighten 3° to 5° past the original position prior to removal.

Stroke Adjustment

⚠ Caution

1. This mechanism is not intended for adjustment of the cushion effect (smooth start-up, soft stop). This mechanism is for matching of the cylinder's stroke end position to the mechanical stopper, etc., of a machine. (adjustment range from 0 to –2 mm)

2. Before adjustment is performed, shut off the drive air, release any residual pressure and implement measures to prevent dropping of workpieces, etc.

Stroke End Adjustment

(To ensure safety, implement with air shut down.)

⚠ Caution

1. Loosen lock nut A.

2. Insert a wrench into the hexagon socket of the adjusting screw, and turn it to the left or right, matching the cushion ring holder (stroke end) with the position of the external stopper by moving it backward or forward.

3. After the stroke end adjustment is completed, retighten lock nut A, and apply high strength Loctite® no. 262 or another comparable locking agent.

Horizontal	$F_1 = \mu \times (W + W_B) \times 9.8$
Inclined	$F_2 = (W + W_B) \times 9.8 \times (\mu\cos\theta + \sin\theta)$
Vertical	$F_3 = (W + W_B) \times 9.8 \times (\mu + 1)$

For the (Fn) of data (A), refer to the allowable driving force table.

W + WB ≤ Wv, P ≤ Pv | Determination of allowable load mass & pressure | W + WB > Wv, P > Pv

(For vertical operation, refer to page 942.)

(For max. load mass when loaded directly on the body, refer to page 942.)

WB > WBmax
Review of connection fitting

Determination of connection fitting mass (WB)

WB ≤ WBmax

(For "Standard Stroke", refer to page 945.)

Review of switches and stroke

Presence of switch rail — Yes → Presence of switch — Yes → Determination of stroke with switch — NG / OK

None (Refer to data (A) on page 941.)

Second tentative determination of bore size from the graph of allowable driving force (Fn) and distance from cylinder shaft center (Lo)

Presence of external guide system — Yes

None

Note 2) WB x L1 > MD

(For body non-rotating accuracy and max. allowable moment, refer to page 943.)

Determination of rotational moment

(Refer to data (B) on page 941.)

Third tentative determination of bore size from the graph of maximum speed (U) and load mass (W).

WB x L1 ≤ MD

(For body non-rotating accuracy and max. allowable moment, refer to page 943.)

(Bore size is the largest of 3 tentative determinations.)

Bore size determination

Note 2) NG — Determination of allowable stroke — OK

Note 1)

Consider made-to-order products, depending on an operating condition.

(Refer to page 945.)

Model selected

Note 1) Made-to-order products should be considered, too, depending on an operating environment, etc.
Note 2) An external guide system should be installed when it is used beyond specifications.

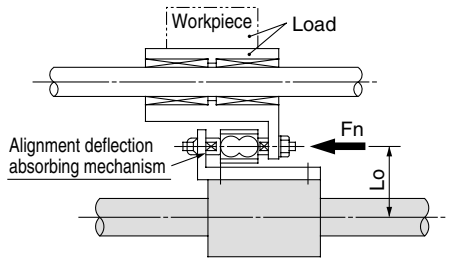
Model Selection 2

Caution on Design 1

Selection Method

Selection Procedures

1. Find the drive resisting force Fn (N) when moving the load horizontally.
2. Find the distance Lo (cm) from the point of the load where driving force is applied, to the center of the cylinder shaft.
3. Select a bore size from Lo and Fn in Data (A).



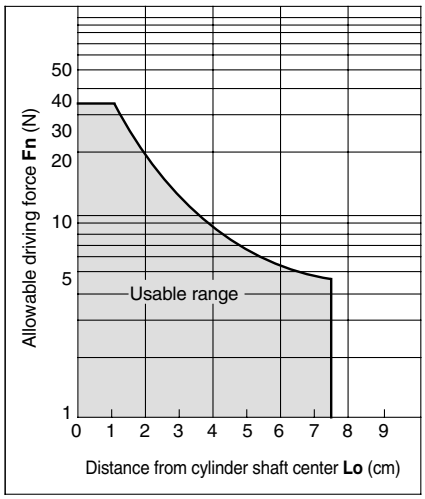
Selection Example

Given a load drive resisting force of Fn = 100 (N) and a distance from the cylinder shaft center to the load application point of Lo = 8 cm, find the intersection point by extending upward from the horizontal axis of data (A) where the distance from the shaft center is 8 cm, and then extending to the side, find the allowable driving force on the vertical axis. Models suitable to satisfy the requirement of 100 (N) are **REAR32** or **REAR40**.

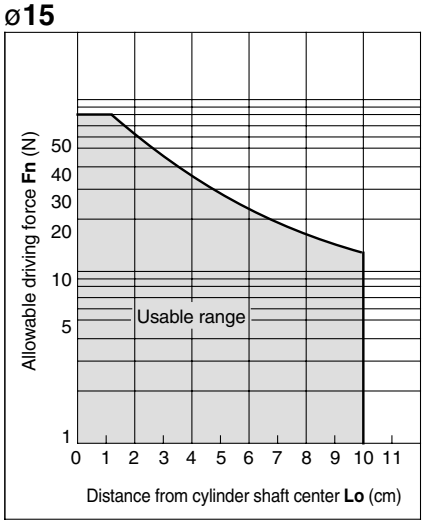
* Distance from cylinder shaft center, Lo, is the moment working point between the cylinder and the load.

<Data (A): Distance from Cylinder Shaft Center ——Allowable Driving Force>

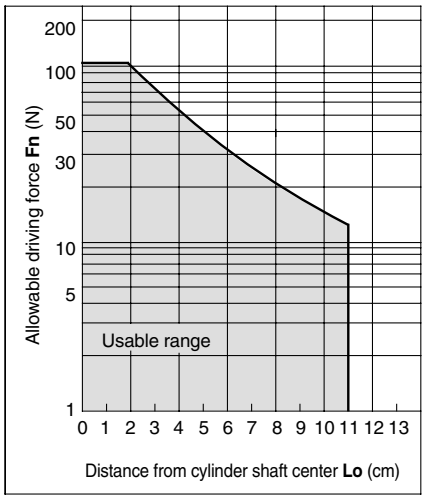
ø10



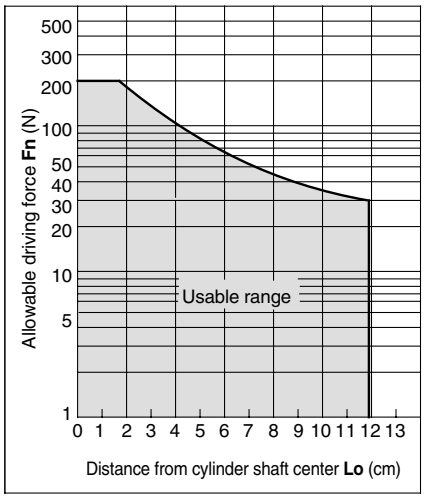
ø15



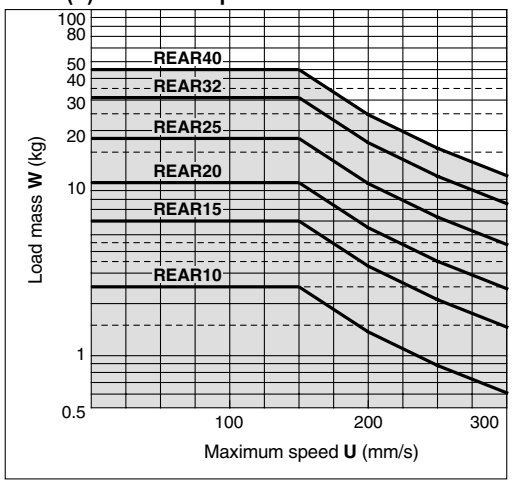
ø20



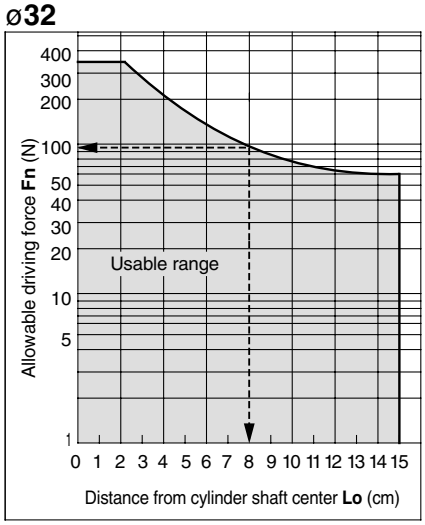
ø25



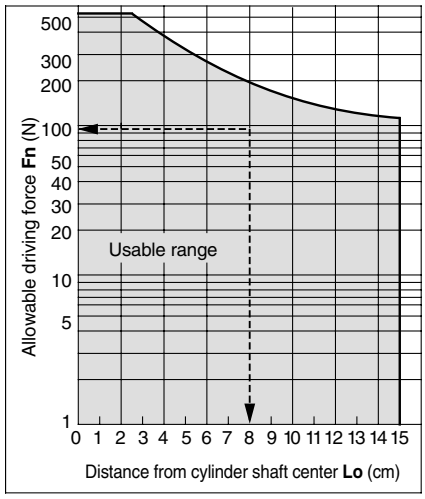
<Data (B): Maximum Speed ——Load Mass Chart>



ø32



ø40

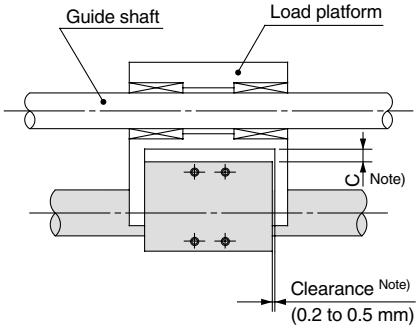


Model Selection 3

Caution on Design 2

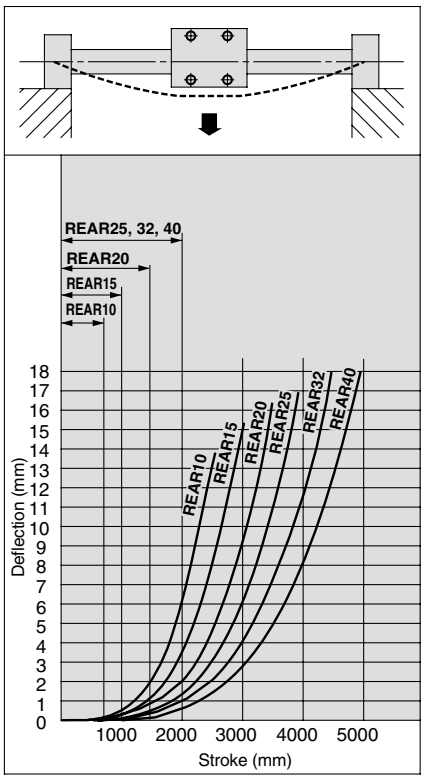
Cylinder Self-weight Deflection

When the cylinder is mounted horizontally, deflection appears due to its own weight as shown in the data, and the longer the stroke, the greater the amount of variation in the shaft centers. Therefore, a connection method should be considered which allows for this variation as shown in the drawing.



The above clearance is for reference.

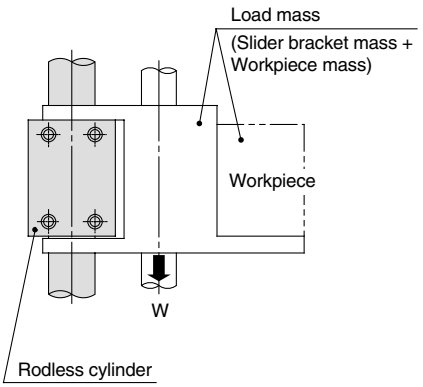
Note) Referring to the self-weight deflection in the graph below, provide clearance so that the cylinder does not touch the mounting surface or the load section, and is able to operate smoothly within the minimum operating pressure range for a full stroke.



∗ The above deflection data indicate values when the external slider has moved to the middle of the stroke.

Vertical Operation

The load should be guided by a ball type bearing (Linear guide, etc.). If a slide bearing is used, sliding resistance will increase due to the load weight and moment, and this can cause malfunction.
When the cylinder is mounted vertically or sidelong, sliders may move downwards due to the self-weight or workpiece mass. If an accurate stopping position is required at the stroke end or the middle-stroke, use an external stopper to secure accurate positioning.



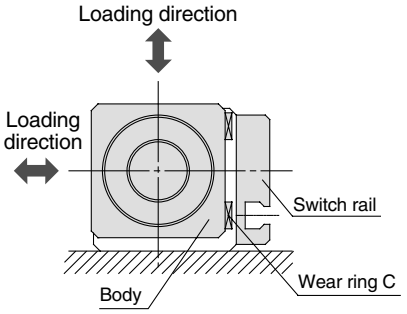
Bore size (mm)	Model	Allowable load mass **Wv** (kg)	Maximum operating pressure **Pv** (MPa)
10	**REAR10**	2.7	0.55
15	**REAR15**	7.0	0.65
20	**REAR20**	11.0	0.65
25	**REAR25**	18.5	0.65
32	**REAR32**	30.0	0.65
40	**REAR40**	47.0	0.65

Note) Use caution, since the magnetic coupling may be dislocated if it is used over the maximum operating pressure.

Maximum Load Mass when Loaded Directly on Body

When the load is applied directly to the body, it should be no greater than the maximum values shown in the table below.

Model	Maximum load mass **WBmax** (kg)
REAR 10	0.4
REAR 15	1.0
REAR 20	1.1
REAR 25	1.2
REAR 32	1.5
REAR 40	2.0



Model Selection 4

Caution on Design 3

Intermediate Stop

The cushion effect (smooth start-up, soft stop) exists only before the stroke end in the stroke ranges indicated in the table below.
The cushion effect (smooth start-up, soft stop) cannot be obtained in an intermediate stop or return from an intermediate stop using an external stopper, etc.

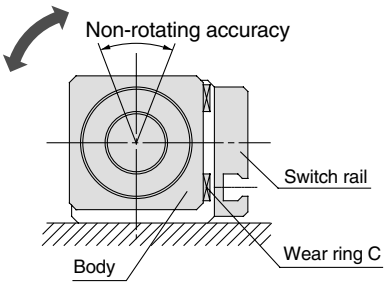
Cushion Stroke

Model	Stroke (mm)
REAR10	20
REAR15	25
REAR20	30
REAR25	30
REAR32	30
REAR40	35

Body Non-rotating Accuracy and Max. Allowable Moment (With switch rail) (Reference values)

Reference values for non-rotating accuracy and maximum allowable moment at stroke end are indicated below.

Bore size (mm)	Non-rotating accuracy (°)	Maximum allowable moment M_D (N·m)	Allowable (2) stroke (mm)
10	6.0	0.05	100
15	4.5	0.15	200
20	3.7	0.20	300
25	3.7	0.25	300
32	3.1	0.40	400
40	2.8	0.62	400



Note 1) Avoid operations where rotational torque (moment) is applied. In such a case, the use of an external guide is recommended.
Note 2) The above reference values will be satisfied within the allowable stroke ranges. However, caution is necessary because as the stroke becomes longer the inclination (rotation angle) within the stroke can be expected to increase.
Note 3) When a load is applied directly to the body, the loaded mass should be no greater than the allowable load mass on page 942.

Other than the models listed in “How to Order”, the following auto switches are applicable. For detailed specifications, refer to pages 1719 to 1827.

Auto switch type	Model	Electrical entry (Fetching direction)	Features	Applicable bore size
Reed	D-Z73, Z76	Grommet (In-line)	—	ø25 to ø40
	D-Z80		Without indicator light	
Solid state	D-Y59A, Y59B, Y7P	Grommet (In-line)	—	
	D-Y7NW, Y7PW, Y7BW		Diagnostic indication (2-color indication)	

∗ For solid state auto switches, auto switches with a pre-wired connector are also available. Refer to pages 1784 and 1785 for details.
∗ Normally closed (NC = b contact) solid state auto switches (D-F9G/F9H/Y7G/Y7H types) are also available. Refer to pages 1746 and 1748 for details.

Series REAR
Specific Product Precautions

Be sure to read before handling. Refer to front matters 42 and 43 for Safety Instructions and pages 3 to 11 for Actuator and Auto Switch Precautions.

Mounting

⚠ Caution

1. Take care to avoid nicks or other damage on the outside surface of the cylinder tube.
This can lead to a damage of the scraper and the wear ring, which in turn can cause malfunction.

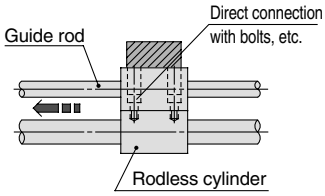
2. Use caution to the rotation of the external slider.
Rotation should be controlled by connecting it to another shaft (linear guide, etc.).

3. Do not operate with the magnetic coupling out of position.
If the magnetic coupling is out of position, push the external slider by hand (or the piston slider with air pressure) back to the proper position at the stroke end.

4. The cylinder is mounted with bolts through the mounting holes in the end covers. Be sure they are tightened securely.

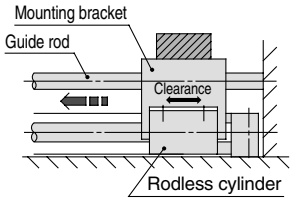
5. Be sure that both end covers are secured to the mounting surface before operating the cylinder.
Avoid operation with the external slider secured to the surface.

6. Do not apply a lateral load to the external slider.
When a load is mounted directly to the cylinder, variations in the alignment of each shaft center cannot be offset, which results in the generation of a lateral load that can cause malfunction. The cylinder should be operated using a connection method which allows for shaft alignment variations and deflection due to the cylinder's own weight. A drawing of a recommended mounting is shown in Fig. (2).



Variations in the load and cylinder shaft alignment cannot be offset and may result in a malfunction.

Figure (1) Incorrect mounting



Shaft alignment variations are offset by providing clearance between the mounting bracket and cylinder.
Moreover, the mounting bracket is extended above the cylinder shaft center, so that the cylinder is not subjected to moment.

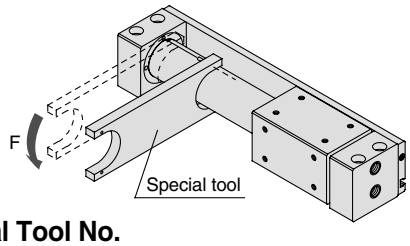
Figure (2) Recommended mounting

7. Use caution regarding the allowable load mass when operating in a vertical direction.
The allowable load mass when operating in a vertical direction (reference values on page 942) is determined by the model selection method, however, if a load greater than the allowable value is applied, the magnetic coupling may break and there is a possibility of dropping the load. When using this type of application, please contact SMC regarding the operating conditions (pressure, load).

Disassembly and Maintenance

⚠ Caution

1. Special tools are necessary for disassembly.



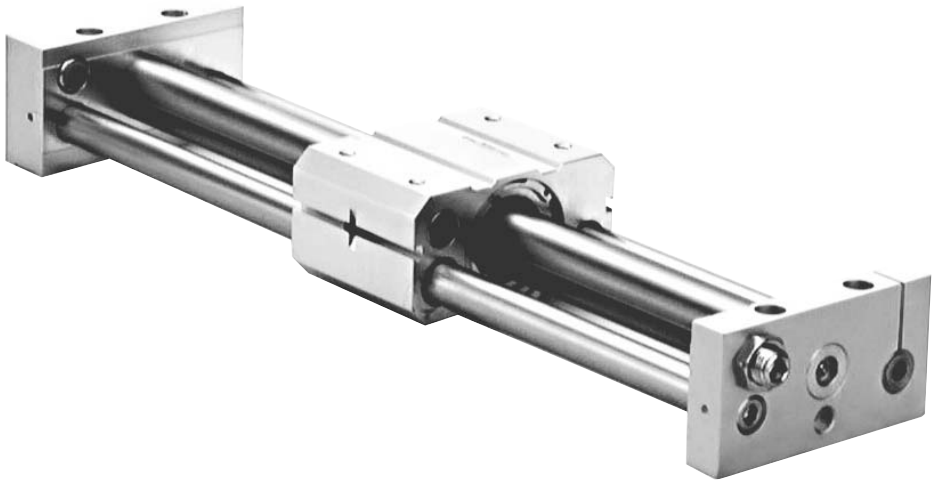
Special Tool No.

Part no.	Applicable bore size (mm)
CYRZ-V	10, 15, 20
CYRZ-W	25, 32, 40

Slider Type/Slide Bearing

Series *REAS*

ø10, ø15, ø20, ø25, ø32, ø40



Model Selection 1

Pv: Maximum operating pressure for vertical operation (MPa)
WA: Allowable load mass based on these operating conditions (kg)
Wv: Allowable load mass for vertical operation (kg)
σ: Stroke coefficient

$$\sigma = \frac{\text{Load mass in stroke}}{\text{Maximum load mass}}$$

Operating Conditions

- W: Load mass (kg)
- U: Maximum speed (mm/s)
- P: Operating pressure (MPa)
- Stroke (mm)
- Lo: Distance from slide block mounting surface to workpiece center of gravity (cm)
- Mode of operation (horizontal, inclined, vertical)

Mode of operation

Horizontal operation

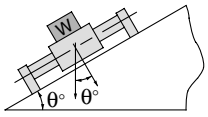
First tentative bore size determination

$$\varnothing D \geq 2.8 \times \sqrt{\frac{W}{P}}$$

Inclined operation

First tentative bore size determination

$$\varnothing D \geq 5.0 \times \sqrt{\frac{0.3 \times W\cos\theta + W\sin\theta}{P}}$$



Inclined operation

Vertical operation

First tentative bore size determination

$$\varnothing D \geq 5.0 \times \sqrt{\frac{0.3 \times W + W}{P}}$$

Determination of allowable load mass & pressure

W > Wv
P > Pv

Review of load mass and operating pressure

(For vertical operation, refer to page 955.)

W ≤ Wv
P ≤ Pv

(For formula to find σ, refer to page 953.)

Calculate stroke coefficient (σ) with stroke and tentatively determined bore size

$$\sigma = \frac{\text{Load mass in stroke}}{\text{Maximum load mass}}$$

Select an example calculation for allowable mass based on cylinder mounting orientation.

(Refer to pages 953 and 954.)

Calculate (WA) from the formula for the tentatively determined bore size

W > WA

Review of bore size, stroke and Lo

W ≤ WA

(Refer to data (B) on page 953.)

Second tentative determination of bore size from graph of maximum speed (U) and load mass (W)

(The larger bore size is selected from two tentative determinations.)

Bore size determination

Note) Made-to-order products should be considered, too, depending on an operating environment, etc.

Note)

Consider made-to-order products, depending on an operating condition.

(Refer to page 957.)

Model selected

Model Selection 2

Caution on Design 1

How to Find σ when Selecting the Allowable Load Mass

Since the maximum load mass with respect to the cylinder stroke changes as shown in the table below, σ should be considered as a coefficient determined in accordance with each stroke.
Example) For REAS25-650

(1) Maximum load mass = 20 kg
(2) Load mass for 650 st = 13.6 kg
(3) $\sigma = \frac{13.6}{20} = 0.68$ is the result.

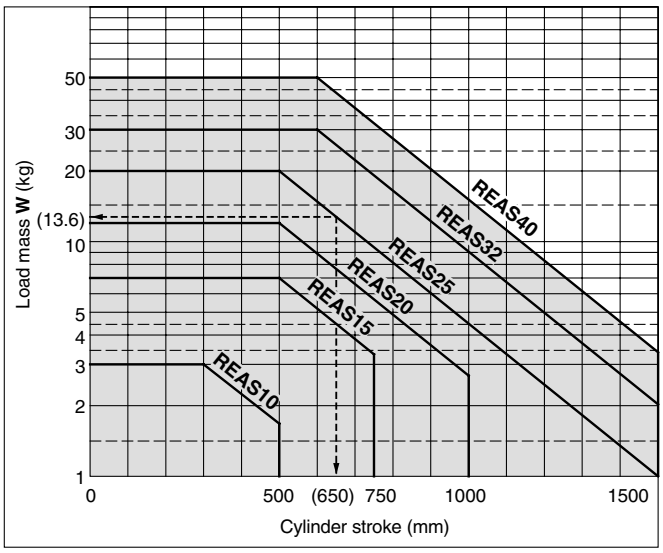
Calculation Formula for σ (σ ≤ 1)

ST: Stroke (mm)

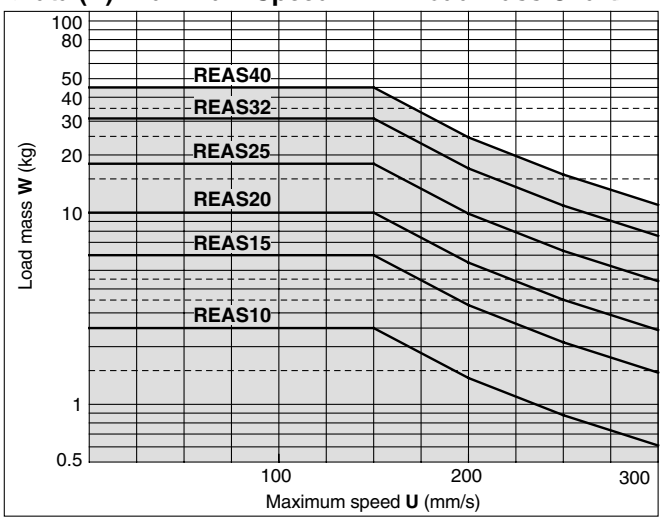
Model	REAS10	REAS15	REAS20
σ=	$\frac{10^{(0.86 - 1.3 \times 10^{-3} \times ST)}}{3}$	$\frac{10^{(1.5 - 1.3 \times 10^{-3} \times ST)}}{7}$	$\frac{10^{(1.71 - 1.3 \times 10^{-3} \times ST)}}{12}$

Model	REAS25	REAS32	REAS40
σ=	$\frac{10^{(1.98 - 1.3 \times 10^{-3} \times ST)}}{20}$	$\frac{10^{(2.26 - 1.3 \times 10^{-3} \times ST)}}{30}$	$\frac{10^{(2.48 - 1.3 \times 10^{-3} \times ST)}}{50}$

Note) Calculate with σ = 1 for all applications up to ø10–300 mmST, ø15–500 mmST, ø20–500 mmST , ø25–500 mmST, ø32–600 mmST, ø40–600 mmST.

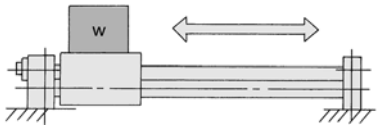


<Data (B): Maximum Speed———Load Mass Chart>



Example of Allowable Load Mass Calculation Based on Cylinder Mounting Orientation

1. Horizontal Operation (Floor mounting)

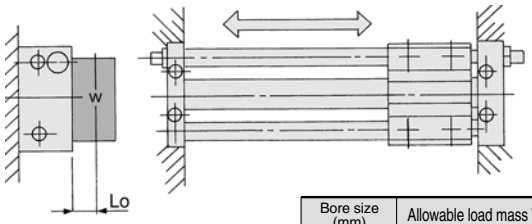


Maximum Load Mass (Center of slide block) (kg)

Bore size (mm)	10	15	20	25	*32*	40
Max. load mass (kg)	3	7	12	20	30	50
Stroke (Max.)	Up to 300st	Up to 500st	Up to 500st	Up to 500st	Up to 600st	Up to 600st

The above maximum load mass values will change with the stroke length for each cylinder size, due to limitation from warping of the guide shafts. (Take note of the coefficient σ.)
Moreover, depending on the operating direction, the allowable load mass may be different from the maximum load mass.

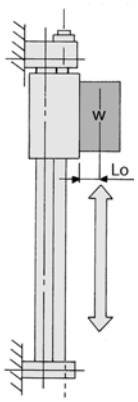
2. Horizontal Operation (Wall mounting)



Lo: Distance from mounting surface to load center of gravity (cm)

Bore size (mm)	Allowable load mass W_A (kg)
10	$\frac{\sigma \cdot 12.0}{8.4 + 2Lo}$
15	$\frac{\sigma \cdot 36.4}{10.6 + 2Lo}$
20	$\frac{\sigma \cdot 74.4}{12 + 2Lo}$
25	$\frac{\sigma \cdot 140}{13.8 + 2Lo}$
32	$\frac{\sigma \cdot 258}{17 + 2Lo}$
40	$\frac{\sigma \cdot 520}{20.6 + 2Lo}$

3. Vertical Operation



Bore size (mm)	Allowable load mass W_A (kg)
10	$\frac{\sigma \cdot 4.16}{2.2 + Lo}$
15	$\frac{\sigma \cdot 13.23}{2.7 + Lo}$
20	$\frac{\sigma \cdot 26.8}{2.9 + Lo}$
25	$\frac{\sigma \cdot 44.0}{3.4 + Lo}$
32	$\frac{\sigma \cdot 88.2}{4.2 + Lo}$
40	$\frac{\sigma \cdot 167.8}{5.1 + Lo}$

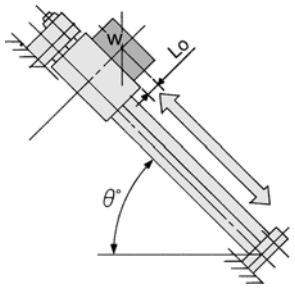
Lo: Distance from mounting surface to load center of gravity (cm)
Note) Consider a safety factor for drop prevention.

Model Selection 3

Caution on Design 2

Example of Allowable Load Mass Calculation Based on Cylinder Mounting Orientation

4. Inclined Operation (in operating direction)



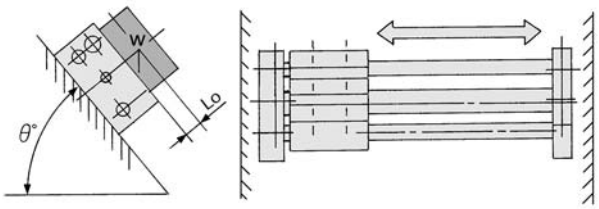
Angle	Up to 45°	Up to 60°	Up to 75°	Up to 90°
k	1	0.9	0.8	0.7

Bore size (mm)	Allowable load mass W_A (kg)
10	$\frac{\sigma \cdot 10.5 \cdot K}{3.5\cos\theta + 2\,(2.2 + Lo)\,\sin\theta}$
15	$\frac{\sigma \cdot 35 \cdot K}{5\cos\theta + 2\,(2.7 + Lo)\,\sin\theta}$
20	$\frac{\sigma \cdot 72 \cdot K}{6\cos\theta + 2\,(2.9 + Lo)\,\sin\theta}$
25	$\frac{\sigma \cdot 120 \cdot K}{6\cos\theta + 2\,(3.4 + Lo)\,\sin\theta}$
32	$\frac{\sigma \cdot 210 \cdot K}{7\cos\theta + 2\,(4.2 + Lo)\,\sin\theta}$
40	$\frac{\sigma \cdot 400 \cdot K}{8\cos\theta + 2\,(5.1 + Lo)\,\sin\theta}$

Angle coefficient (k): **k** = [up to 45° (= θ)] = 1,
[up to 60°] = 0.9, [up to 75°] = 0.8,
[up to 90°] = 0.7

Lo: Distance from mounting surface to load center of gravity (cm)

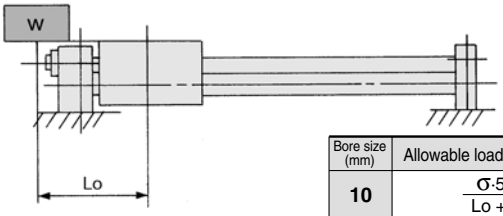
5. Inclined Operation (at a right angle to operating direction)



Lo: Distance from mounting surface to load center of gravity (cm)

Bore size (mm)	Allowable load mass W_A (kg)
10	$\frac{\sigma \cdot 12.0}{4 + 2\,(2.2 + Lo)\,\sin\theta}$
15	$\frac{\sigma \cdot 36.4}{5.2 + 2\,(2.7 + Lo)\,\sin\theta}$
20	$\frac{\sigma \cdot 74.4}{6.2 + 2\,(2.9 + Lo)\,\sin\theta}$
25	$\frac{\sigma \cdot 140}{7 + 2\,(3.4 + Lo)\,\sin\theta}$
32	$\frac{\sigma \cdot 258}{8.6 + 2\,(4.2 + Lo)\,\sin\theta}$
40	$\frac{\sigma \cdot 520}{10.4 + 2\,(5.1 + Lo)\,\sin\theta}$

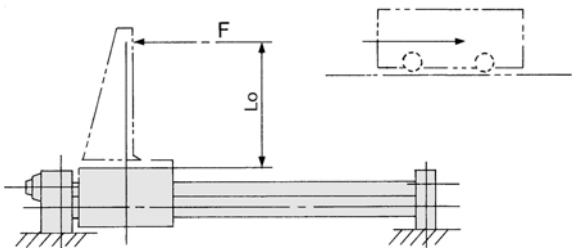
6. Load Center Offset in Operating Direction (Lo)



Lo: Distance from center of slide block to load's center of gravity (cm)

Bore size (mm)	Allowable load mass W_A (kg)
10	$\frac{\sigma \cdot 5.25}{Lo + 3.5}$
15	$\frac{\sigma \cdot 17.5}{Lo + 5.0}$
20	$\frac{\sigma \cdot 36}{Lo + 6.0}$
25	$\frac{\sigma \cdot 60}{Lo + 6.0}$
32	$\frac{\sigma \cdot 105}{Lo + 7.0}$
40	$\frac{\sigma \cdot 200}{Lo + 8.0}$

7. Horizontal Operation (Pushing load, Pusher)

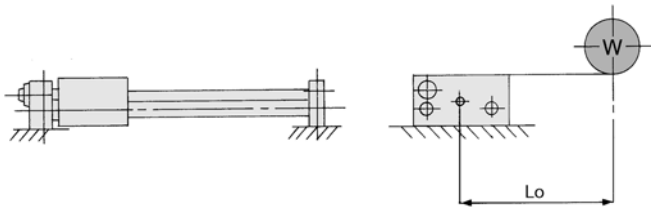


F: Drive (from slide block to position Lo) resistance force (kg)
Lo: Distance from mounting surface to load center of gravity (cm)

Bore size (mm)	10	15	20
Allowable load mass W_A (kg)	$\frac{\sigma \cdot 5.25}{2.2 + Lo}$	$\frac{\sigma \cdot 17.5}{2.7 + Lo}$	$\frac{\sigma \cdot 36}{2.9 + Lo}$

Bore size (mm)	25	32	40
Allowable load mass W_A (kg)	$\frac{\sigma \cdot 60}{3.4 + Lo}$	$\frac{\sigma \cdot 105}{4.2 + Lo}$	$\frac{\sigma \cdot 200}{5.1 + Lo}$

8. Horizontal Operation (Load, Lateral offset Lo)



Lo: Distance from mounting surface to load center of gravity (cm)

Bore size (mm)	10	15	20
Allowable load mass W_A (kg)	$\frac{\sigma \cdot 8.40}{4 + Lo}$	$\frac{\sigma \cdot 25.48}{5.2 + Lo}$	$\frac{\sigma \cdot 52.1}{6.2 + Lo}$

Bore size (mm)	25	32	40
Allowable load mass W_A (kg)	$\frac{\sigma \cdot 98}{7.0 + Lo}$	$\frac{\sigma \cdot 180}{8.6 + Lo}$	$\frac{\sigma \cdot 364}{10.4 + Lo}$

Model Selection 4

Caution on Design 3

Vertical Operation

When operating a load vertically, it should be operated within the allowable load mass and maximum operating pressures shown in the table below.
Use caution since operating above the prescribed values may lead to a dropping of the load with the magnetic coupling out of position.
When the cylinder is mounted vertically or sidelong, sliders may move downwards due to the self-weight or workpiece mass. If an accurate stopping position is required at the stroke end or the middle-stroke, use an external stopper to secure accurate positioning.

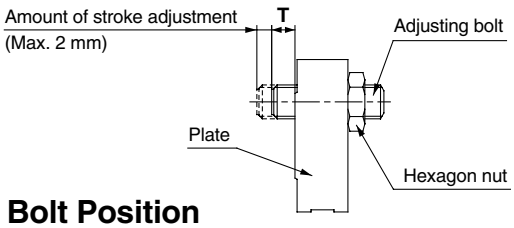
Bore size (mm)	Model	Allowable load mass **Wv** (kg)	Max. operating pressure **Pv** (MPa)
10	**REAS10**	2.7	0.55
15	**REAS15**	7.0	0.65
20	**REAS20**	11.0	0.65
25	**REAS25**	18.5	0.65
32	**REAS32**	30.0	0.65
40	**REAS40**	47.0	0.65

Stroke Adjustment

The adjusting bolt is adjusted to the optimum position for smooth acceleration and deceleration at the time of shipment, and should be operated at the full stroke. When stroke adjustment is necessary, the maximum amount of adjustment on one side is 2 mm. (Do not adjust more than 2 mm, as it will not be possible to obtain smooth acceleration and deceleration.)

Stroke adjustment method

Loosen the hexagon nut, and after performing the stroke adjustment from the plate side with a hexagon wrench, retighten and secure the hexagon nut.



Adjusting Bolt Position (at the time of shipment), Hexagon Nut Tightening Torque

Model	**T** (mm)	Tightening torque (N·m)
REAS10	1	1.67
REAS15	1	
REAS20	1.5	3.14
REAS25	1.5	10.8
REAS32	3	23.5
REAS40	2	

Intermediate Stop

The cushion effect (smooth start-up, soft stop) exists only before the stroke end in the stroke ranges indicated in the table below.
The cushion effect (smooth start-up, soft stop) cannot be obtained in an intermediate stop or a return from an intermediate stop using an external stopper, etc.

∗ Since this is a guideline including hysteresis, not meant to be guaranteed. (assuming approximately ±30% dispersion)
There may be the case it will vary substantially depending on an ambient environment.

Other than the models listed in “How to Order”, the following auto switches are applicable. For detailed specifications, refer to page 1770.

Auto switch type	Model	Electrical entry (Fetching direction)	Features
Solid state	D-F7NTL	Grommet (In-line)	With timer

∗ For solid state auto switches, auto switches with a pre-wired connector are also available.
Refer to pages 1784 and 1785 for details.

Series REAS
Specific Product Precautions

Be sure to read before handling. Refer to front matters 42 and 43 for Safety Instructions and pages 3 to 11 for Actuator and Auto Switch Precautions.

Operation

⚠ Warning

1. Be aware of the space between the plates and the slide block.
Take sufficient care to avoid getting your hands or fingers caught when the cylinder is operated.

2. Do not apply a load to a cylinder which is greater than the allowable value stated in the "Model Selection" pages.
It may cause malfunction.

3. Consult with SMC when the cylinder is operated in an environment in which the cylinder is exposed to cutting fluid or water, or the cylinder sliding part lubrication deteriorates.

4. When applying grease to the cylinder, use the grease already used for the product. Contact SMC, grease packs are available.

Mounting

⚠ Caution

1. Avoid operation with the external slider fixed to the mounting surface.
The cylinder should be operated with the plates fixed to the mounting surface.

2. Make sure that the cylinder mounting surface has a flatness of 0.2 mm or less.
If the flatness of a workpiece is not appropriate, it may adversely affect the operation since two guide shafts will be twisted. Furthermore, the increase of the sliding resistance and early abrasion of bearings may shorten the service life.

The cylinder mounting surface must have a flatness of 0.2 mm or less, and the cylinder must be mounted so as to be smoothly operated with a minimum operating pressure (0.18 MPa or less) for a full stroke.

Disassembly and Maintenance

⚠ Warning

1. Use caution, the attractive force of the magnets is very strong.
When removing the external slider and piston slider from the cylinder tube for maintenance, etc., handle with caution since the magnet installed in each slider has a very strong attractive force.

⚠ Caution

1. Use caution when taking off the external slider, since the piston slider will be directly attracted to it.
When removing the external slider or piston slider from the cylinder tube, first force the sliders out of their magnetically coupled positions, and then remove them individually when there is no longer any holding force. If they are removed while still magnetically coupled, they will be directly attracted to one another and will not come apart.

2. Do not disassemble the magnetic components (piston and external sliders).
This may cause a loss of holding force and malfunction.

Slider Type/Ball Bushing Bearing

Series *REAL*

Model Selection 1

Pv: Maximum operating pressure for vertical operation (MPa)
WA: Allowable load mass based on these operating conditions (kg)
Wv: Allowable load mass for vertical operation (kg)
σ: Stroke coefficient

$$\sigma = \frac{\text{Load mass in stroke}}{\text{Maximum load mass}}$$

Operating Conditions

- W: Load mass (kg)
- P: Operating pressure (MPa)
- Lo: Distance from slide block mounting surface to workpiece center of gravity (cm)
- Mode of operation (horizontal, inclined, vertical)
- U: Maximum speed (mm/s)
- Stroke (mm)

Mode of operation

- Horizontal operation
- Inclined operation
- Vertical operation

Review of load mass and operating pressure

First tentative bore size determination

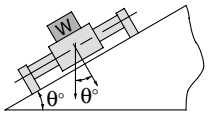
$$\varnothing D \geq 1.6 \times \sqrt{\frac{W}{P}}$$

First tentative bore size determination

$$\varnothing D \geq 5.0 \times \sqrt{\frac{0.1 \times W\cos\theta + W\sin\theta}{P}}$$

First tentative bore size determination

$$\varnothing D \geq 5.0 \times \frac{0.1 \times W + W}{P}$$



Inclined operation

Determination of allowable load mass & pressure

W > Wv
P > Pv

(For vertical operation, refer to page 969.)

W ≤ Wv
P ≤ Pv

(For formula to find σ, refer to page 967.)

Calculate stroke coefficient (σ) with stroke and tentatively determined bore size

$$\sigma = \frac{\text{Load mass in stroke}}{\text{Maximum load mass}}$$

Select an example calculation for allowable mass based on cylinder mounting orientation.

(Refer to pages 967 and 968.)

Calculate (W_A) from the formula for the tentatively determined bore size

W > WA

Review of bore size, stroke and Lo

W ≤ WA

(Refer to data (B) on page 967.)

Second tentative determination of bore size from graph of maximum speed (U) and load mass (W)

(The larger bore size is selected from two tentative determinations.)

Bore size determination

Note) Made-to-order products should be considered, too, depending on an operating environment, etc.

Note)

Consider made-to-order products, depending on an operating condition.

(Refer to page 971.)

Model selected

Model Selection 2

Caution on Design 1

How to Find σ when Selecting the Allowable Load Mass

Since the maximum load mass with respect to the cylinder stroke changes as shown in the table below, σ should be considered as a coefficient determined in accordance with each stroke.
Example) For REAL25-650

(1) Maximum load mass = 20 kg
(2) Load mass for 650 st = 13.6 kg

(3) $S = \frac{13.6}{20} = 0.68$ is the result.

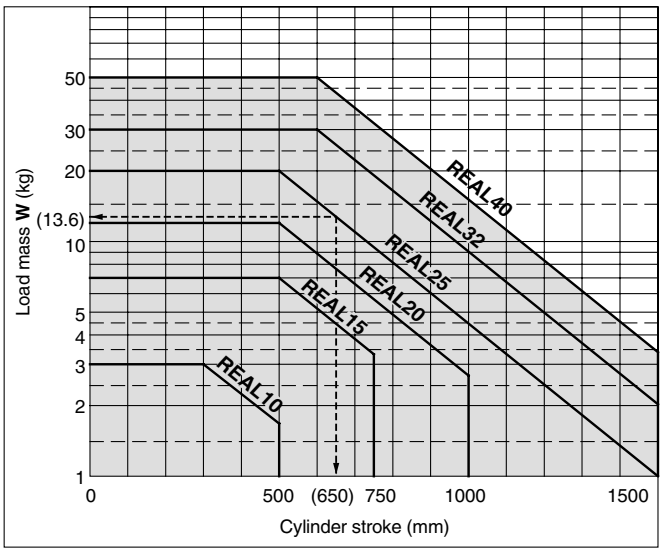
Calculation Formula for σ (σ ≤ 1)

ST: Stroke (mm)

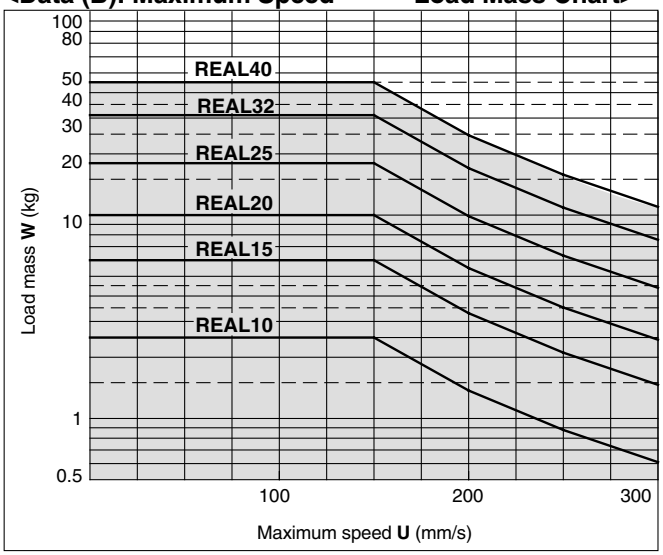
Model	REAL10	REAL15	REAL20
σ =	$\frac{10^{(0.86 - 1.3 \times 10^{-3} \times ST)}}{3}$	$\frac{10^{(1.5 - 1.3 \times 10^{-3} \times ST)}}{7}$	$\frac{10^{(1.71 - 1.3 \times 10^{-3} \times ST)}}{12}$

Model	REAL25	REAL32	REAL40
σ =	$\frac{10^{(1.98 - 1.3 \times 10^{-3} \times ST)}}{20}$	$\frac{10^{(2.26 - 1.3 \times 10^{-3} \times ST)}}{30}$	$\frac{10^{(2.48 - 1.3 \times 10^{-3} \times ST)}}{50}$

Note) Calculate with σ = 1 for all applications up to ø10–300 mmST, ø15–500 mmST, ø20–500 mmST , ø25–500 mmST, ø32–600 mmST, ø40–600 mmST.

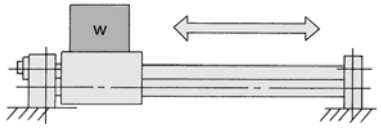


<Data (B): Maximum Speed———Load Mass Chart>



Examples of Allowable Load Mass Calculation Based on Cylinder Mounting Orientation

1. Horizontal Operation (Floor mounting)

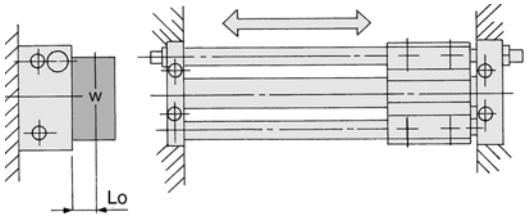


Maximum Load Mass (Center of slide block) (kg)

Bore size (mm)	10	15	20	25	32	40
Maximum load mass (kg)	3	7	12	20	30	50
Stroke (max)	Up to 300 st	Up to 500 st	Up to 500 st	Up to 500 st	Up to 600 st	Up to 600 st

The above maximum load mass values will change with the stroke length for each cylinder size, due to limitation from warping of the guide shafts. (Take note of the coefficient σ.)
Moreover, depending on the operating direction, the allowable load mass may be different from the maximum load mass.

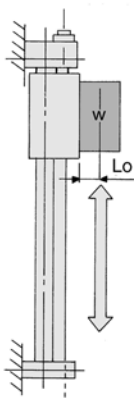
2. Horizontal Operation (Wall mounting)



Lo: Distance from mounting surface to load center of gravity (cm)

Bore size (mm)	Allowable load mass W_A (kg)
10	$\frac{\sigma \cdot 15.0}{8.9 + 2Lo}$
15	$\frac{\sigma \cdot 45.5}{11.3 + 2Lo}$
20	$\frac{\sigma \cdot 101}{13.6 + 2Lo}$
25	$\frac{\sigma \cdot 180}{15.2 + 2Lo}$
32	$\frac{\sigma \cdot 330}{18.9 + 2Lo}$
40	$\frac{\sigma \cdot 624}{22.5 + 2Lo}$

3. Vertical Operation



Bore size (mm)	Allowable load mass W_A (kg)
10	$\frac{\sigma \cdot 5.00}{1.95 + Lo}$
15	$\frac{\sigma \cdot 15.96}{2.4 + Lo}$
20	$\frac{\sigma \cdot 31.1}{2.8 + Lo}$
25	$\frac{\sigma \cdot 54.48}{3.1 + Lo}$
32	$\frac{\sigma \cdot 112.57}{3.95 + Lo}$
40	$\frac{\sigma \cdot 212.09}{4.75 + Lo}$

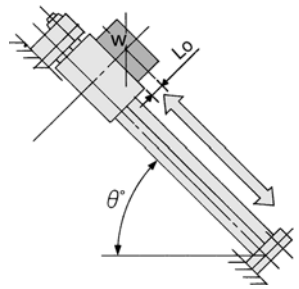
Lo: Distance from mounting surface to load center of gravity (cm)
Note) Consider a safety factor for drop prevention.

Model Selection 3

Caution on Design 2

Examples of Allowable Load Mass Calculation Based on Cylinder Mounting Orientation

4. Inclined Operation (in operating direction)



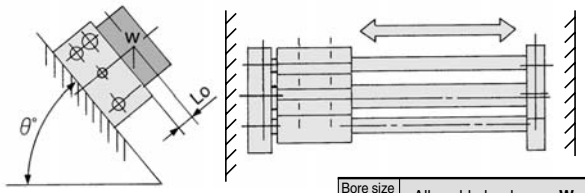
Angle	up to 45°	up to 60°	up to 75°	up to 90°
k	1	0.9	0.8	0.7

Bore size (mm)	Allowable load mass W_A (kg)
10	$\frac{\sigma \cdot 10.2 \cdot K}{2.8\cos\theta + 2\,(1.95 + Lo)\,\sin\theta}$
15	$\frac{\sigma \cdot 31.1 \cdot K}{2.9\cos\theta + 2\,(2.4 + Lo)\,\sin\theta}$
20	$\frac{\sigma \cdot 86.4 \cdot K}{6\cos\theta + 2\,(2.8 + Lo)\,\sin\theta}$
25	$\frac{\sigma \cdot 105.4 \cdot K}{3.55\cos\theta + 2\,(3.1 + Lo)\,\sin\theta}$
32	$\frac{\sigma \cdot 178 \cdot K}{4\cos\theta + 2\,(3.95 + Lo)\,\sin\theta}$
40	$\frac{\sigma \cdot 361.9 \cdot K}{5.7\cos\theta + 2\,(4.75 + Lo)\,\sin\theta}$

Angle coefficient (**k**): k = [up to 45° (= θ)] = 1,
[up to 60°] = 0.9, [up to 75°] = 0.8,
[up to 90°] = 0.7

Lo: Distance from mounting surface to load center of gravity (cm)

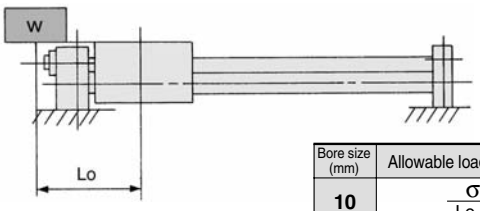
5. Inclined Operation (at a right angle to operating direction)



Lo: Distance from mounting surface to load center of gravity (cm)

Bore size (mm)	Allowable load mass **W_A** (kg)
10	$\frac{\sigma \cdot 15}{5 + 2\,(1.95 + Lo)\,\sin\theta}$
15	$\frac{\sigma \cdot 45.5}{6.5 + 2\,(2.4 + Lo)\,\sin\theta}$
20	$\frac{\sigma \cdot 115}{8 + 2\,(2.8 + Lo)\,\sin\theta}$
25	$\frac{\sigma \cdot 180}{9 + 2\,(3.1 + Lo)\,\sin\theta}$
32	$\frac{\sigma \cdot 330}{11 + 2\,(3.95 + Lo)\,\sin\theta}$
40	$\frac{\sigma \cdot 624}{13 + 2\,(4.75 + Lo)\,\sin\theta}$

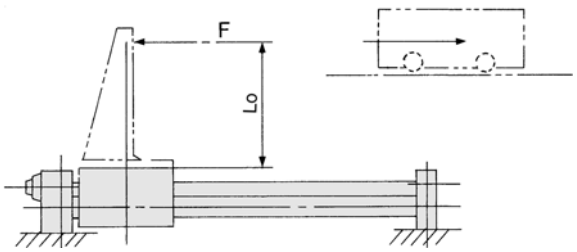
6. Load Center Offset in Operating Direction (Lo)



Lo: Distance from center of slide block to load center of gravity (cm)

Bore size (mm)	Allowable load mass **W_A** (kg)
10	$\frac{\sigma \cdot 5.6}{Lo + 2.8}$
15	$\frac{\sigma \cdot 13.34}{Lo + 2.9}$
20	$\frac{\sigma \cdot 43.2}{Lo + 6}$
25	$\frac{\sigma \cdot 46.15}{Lo + 3.55}$
32	$\frac{\sigma \cdot 80}{Lo + 4}$
40	$\frac{\sigma \cdot 188.1}{Lo + 5.7}$

7. Horizontal Operation (Pushing load, Pusher)

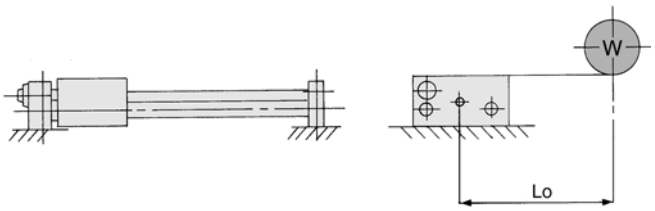


F: Drive (from slide block to position Lo) resistance force (kg)
Lo: Distance from mounting surface to load center of gravity (cm)

Bore size (mm)	10	15	20
Allowable load mass **W_A** (kg)	$\frac{\sigma \cdot 5.55}{1.95 + Lo}$	$\frac{\sigma \cdot 15.96}{2.4 + Lo}$	$\frac{\sigma \cdot 41.7}{2.8 + Lo}$

Bore size (mm)	25	32	40
Allowable load mass **W_A** (kg)	$\frac{\sigma \cdot 58.9}{3.1 + Lo}$	$\frac{\sigma \cdot 106.65}{3.95 + Lo}$	$\frac{\sigma \cdot 228}{4.75 + Lo}$

8. Horizontal Operation (Load, Lateral offset Lo)



Lo: Distance from center of side block to load's center of gravity (cm)

Bore size (mm)	10	15	20
Allowable load mass **W_A** (kg)	$\frac{\sigma \cdot 15}{5 + Lo}$	$\frac{\sigma \cdot 45.5}{6.5 + Lo}$	$\frac{\sigma \cdot 80.7}{8 + Lo}$

Bore size (mm)	25	32	40
Allowable load mass **W_A** (kg)	$\frac{\sigma \cdot 144}{9 + Lo}$	$\frac{\sigma \cdot 275}{11 + Lo}$	$\frac{\sigma \cdot 520}{13 + Lo}$

Model Selection 4

Caution on Design 3

Vertical Operation

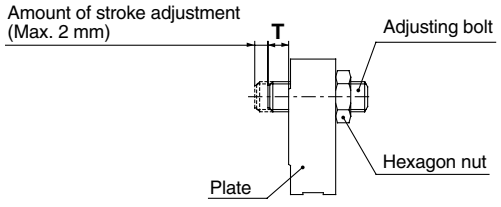
When operating a load vertically, it should be operated within the allowable load weights and maximum operating pressures shown in the table below.
Use caution since operating above the prescribed values may lead to a dropping of the load with the magnetic coupling out of position.
When the cylinder is mounted vertically or sidelong, sliders may move downwards due to the self-weight or workpiece mass. If an accurate stopping position is required at the stroke end or the middle-stroke, use an external stopper to secure accurate positioning.

Bore size (mm)	Model	Allowable load mass **Wv** (kg)	Maximum operating pressure **Pv** (MPa)
10	**REAL10**	2.7	0.55
15	**REAL15**	7.0	0.65
20	**REAL20**	11.0	0.65
25	**REAL25**	18.5	0.65
32	**REAL32**	30.0	0.65
40	**REAL40**	47.0	0.65

Stroke Adjustment

The adjusting bolt is adjusted to the optimum position for smooth acceleration and deceleration at the time of shipment, and should be operated at the full stroke. When stroke adjustment is necessary, the maximum amount of adjustment on one side is 2 mm. (Do not adjust more than 2 mm, as it will not be possible to obtain smooth acceleration and deceleration.)

Stroke adjustment method
Loosen the hexagon nut, and after performing the stroke adjustment from the plate side with a hexagon wrench, retighten and secure the hexagon nut.



Adjusting Bolt Position (at the time of shipment), Hexagon Nut Tightening Torque

Model	**T** (mm)	Tightening torque (N·m)

∗ Since this is a guideline including hysteresis, not meant to be guaranteed. (assuming approximately ±30% dispersion)
There may be the case it will vary substantially depending on an ambient environment.

Other than the models listed in “How to Order”, the following auto switches are applicable. For detailed specifications, refer to page 1770.

Auto switch type	Model	Electrical entry (Fetching direction)	Features
Solid state	D-F7NTL	Grommet (In-line)	With timer

∗ For solid state auto switches, auto switches with a pre-wired connector are also available.
Refer to pages 1784 and 1785 for details.

Series REAL
Specific Product Precautions

Be sure to read before handling. Refer to front matters 42 and 43 for Safety Instructions and pages 3 to 11 for Actuator and Auto Switch Precautions.

Operation

⚠ Warning

1. Be aware of the space between the plates and the slide block.
Take sufficient care to avoid getting your hands or fingers caught when the cylinder is operated.

2. Do not apply a load to a cylinder which is greater than the allowable value stated in the "Model Selection" pages.
It may cause malfunction.

3. Consult with SMC when the cylinder is operated in an environment in which the cylinder is exposed to cutting fluid or water, or the cylinder sliding part lubrication deteriorates.

4. When applying grease to the cylinder, use the grease already used for the product. Contact SMC, grease packs are available.

Mounting

⚠ Caution

1. Avoid operation with the external slider fixed to the mounting surface.
The cylinder should be operated with the plates fixed to the mounting surface.

2. Make sure that the cylinder mounting surface has a flatness of 0.2 mm or less.

If the flatness of a workpiece is not appropriate, it may adversely affect the operation since two guide shafts will be twisted. Furthermore, the increase of the sliding resistance and early abrasion of bearings may shorten the service life.

The cylinder mounting surface must have a flatness of 0.2 mm or less, and the cylinder must be mounted so as to be smoothly operated with a minimum operating pressure (0.18 MPa or less) for a full stroke.

Disassembly and Maintenance

⚠ Warning

1. Use caution, the attractive force of the magnets is very strong.
When removing the external slider and piston slider from the cylinder tube for maintenance, etc., handle with caution since the magnet installed in each slider has a very strong attractive force.

⚠ Caution

1. Use caution when taking off the external slider, since the piston slider will be directly attracted to it.
When removing the external slider or piston slider from the cylinder tube, first force the sliders out of their magnetically coupled positions, and then remove them individually when there is no longer any holding force. If they are removed while still magnetically coupled, they will be directly attracted to one another and will not come apart.

2. Do not disassemble the magnetic components (piston and external sliders).
This may cause a loss of holding force and malfunction.

Linear Guide Type Single Axis/Double Axes

Series REAH/REAHT

Single Axis: ø10, ø15, ø20, ø25

Double Axes: ø25, ø32

REAHT

REAH

Model Selection 1

Pv: Maximum operating pressure for vertical operation (MPa)
Wv: Allowable load mass for vertical operation (kg)
α: Load factor

$$\Sigma\alpha = \frac{\text{Load mass (W)}}{\text{Max. load mass (Wmax)}} + \frac{\text{Static moment (M)}}{\text{Allowable static moment (Mmax)}} + \frac{\text{Dynamic moment (Me)}}{\text{Allowable dynamic moment (Memax)}}$$

Operating Conditions

- W: Load mass (kg)
- U: Maximum speed (mm/s)
- P: Operating pressure (MPa)
- Stroke (mm)
- Position of workpiece center of gravity (m)
- Mode of operation (horizontal, inclined, vertical)

Mode of operation

Horizontal operation

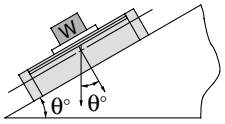
First tentative bore size determination

$$\varnothing D \geq 1.6 \times \sqrt{\frac{W}{P}}$$

Inclined operation

First tentative bore size determination

$$\varnothing D \geq 5.0 \times \sqrt{\frac{0.1 \times W\cos\theta + W\sin\theta}{P}}$$



Inclined operation

Vertical operation

First tentative bore size determination

$$\varnothing D \geq 5.0 \times \sqrt{\frac{0.1 \times W + W}{P}}$$

Determination of allowable load weight & pressure

$W > Wv$
$P > Pv$

Review of load mass and operating pressure

(For vertical operation, refer to page 983.)

$W \leq Wv$
$P \leq Pv$

(Refer to page 981.)

Determination of load factor ($\Sigma\alpha$)

$\Sigma\alpha > 1$ **Review of operating conditions**

$$\Sigma\alpha = \frac{\text{Load mass(W)}}{\text{Max. load mass (Wmax)}} + \frac{\text{Static moment (M)}}{\text{Allowable static moment (Mmax)}} + \frac{\text{Dynamic moment (Me)}}{\text{Allowable dynamic moment (Memax)}}$$

$\Sigma\alpha \leq 1$

(Refer to data (B) on page 981.)

Second tentative determination of bore size from the graph of maximum speed (U) and load mass (W)

Bore size determination (The larger bore size is selected from two tentative determinations)

Note) **Consider made-to-order products, depending on an operating condition.**

Note) Made-to-order products should be considered, too, depending on an operating environment, etc.

(Refer to page 986.)

Model selected

Model Selection 2

Caution on Design 1

The load mass allowable moment differs depending on the workpiece mounting method, cylinder mounting orientation and piston speed. In making a determination of usability, do not allow the sum ($\Sigma\alpha n$) of the load factors (αn) for each mass and moment to exceed "1".

$$\Sigma\alpha n = \frac{\text{Load mass (W)}}{\text{Maximum load mass (Wmax)}} + \frac{\text{Static moment (M)}}{\text{Allowable static moment (Mmax)}} + \frac{\text{Dynamic moment (Me)}}{\text{Allowable dynamic moment (Memax)}} \leq 1$$

Load Mass

Maximum Load Mass (kg)

Model	W_{max}

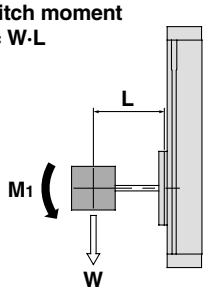
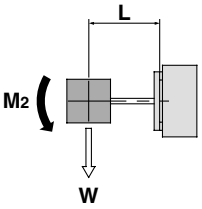
Static Moment

Moment generated by the workpiece mass even when the cylinder is stopped

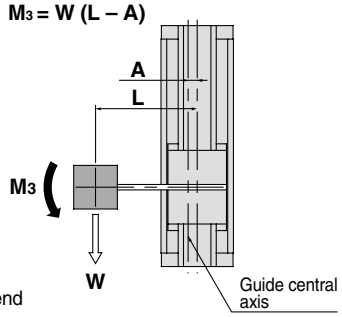
■ **Pitch moment**
$M_1 = W \cdot L$



■ **Roll moment**
$M_2 = W \cdot L$



■ **Yaw moment**
$M_3 = W (L - A)$



(mm)

Model	A
REAH10	15
REAH15	17.5
REAH20	19.5
REAH25	23.5
REAHT25	0 *
REAHT32	0 *

* Since there are 2 guides, the guide's central axis and the cylinder's central axis are the same.

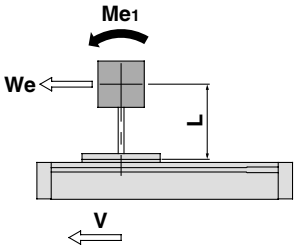
Dynamic Moment

Moment generated by the load equivalent to impact at the stroke end

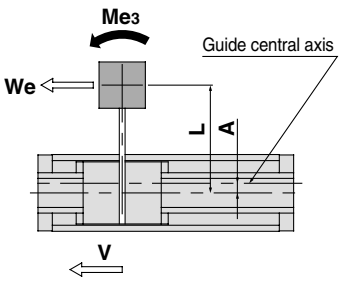
$We = 5 \times 10^{-3} \cdot W \cdot g \cdot U$

We: Load equivalent to impact [N]
W: Load mass [kg]
U: Maximum speed [mm/s]
g: Gravitational acceleration (≅ 9.8 m/s²)

■ **Pitch moment**
$Me_1 = 1/3 \cdot We \cdot L$



■ **Yaw moment**
$Me_3 = 1/3 \cdot We (L - A)$



(mm)

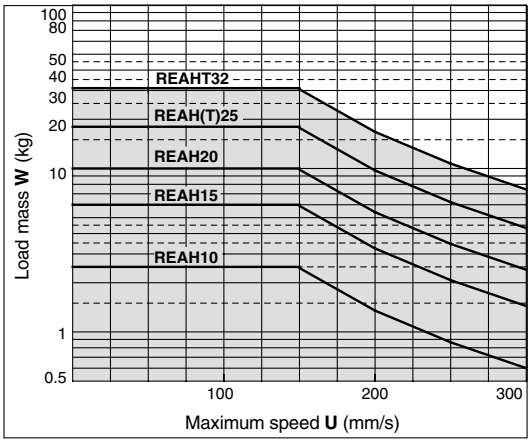
REAH10	15
REAH15	17.5
REAH20	19.5
REAH25	23.5
REAHT25	0 *
REAHT32	0 *

* Since there are 2 guides, the guide's central axis and the cylinder's central axis are the same.

<Data (B): Maximum Speed—Load Mass Chart>



Model Selection 3

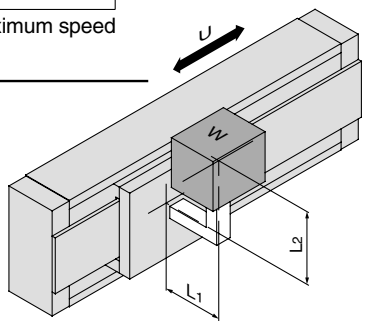
Selection Calculation

The selection calculation finds the load factors (αn) of the items below, where the total ($\Sigma\alpha n$) does not exceed 1.

$$\Sigma\alpha n = \alpha_1 + \alpha_2 + \alpha_3 \leq 1$$

Item	Load factor αn	Note
1. Max. load mass	α_1 = W/Wmax	Review W. Wmax is the maximum load mass.
2. Static moment	α_2 = M/Mmax	Review M_1, M_2, M_3. Mmax is the allowable moment.
3. Dynamic moment	α_3 = Me/Memax	Review Me_1, Me_3. Memax is the allowable moment.

U: Maximum speed



Calculation Example

Operating Conditions

Cylinder: REAH15
Mounting: Horizontal wall mounting style
Maximum speed: **U** = 300 [mm/s]
Load mass: **W** = 1 [kg] (Except mass of arm section)
L1 = 200 [mm]
L2 = 200 [mm]

Item	Load factor αn	Note
1. Maximum load mass 	α_1 = W/Wmax = 1/9 = **0.111**	Examine W.
2. Static moment 	**M_2** = W·L_1 = 10 · 0.2 = 2 [N·m] α_2 = M_2/M_2max = 2/16 = **0.125** W = 1 [kg] = 10 [N]	Examine M_2. Since M_1 & M_3 are not generated, investigation is unnecessary.
3. Dynamic moment 	**We** = 5×10^{-3}·W·g·U = 5×10^{-3} · 1 · 9.8 · 300 = 15 [N] **Me_3** = 1/3·We (L_2–A) = 1/3 · 15 · 0.182 = 0.91 [N·m] α_3 = Me_3/Me_3max = 0.91/10 = **0.091**	Examine Me_3.
	Me_1 = 1/3·We·L_1 = 1/3 · 15 · 0.2 = 1 [N·m] α_4 = Me_1 /Me_1max = 1/10 = **0.1**	Examine Me_1.

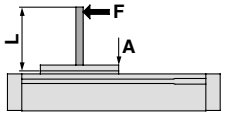
$\Sigma\alpha n = \alpha_1 + \alpha_2 + \alpha_3 + \alpha_4$
= 0.111 + 0.125 + 0.091 + 0.10
= 0.427
Can be used base on $\Sigma\alpha n = 0.427 \leq 1$

Model Selection 4

Caution on Design 2

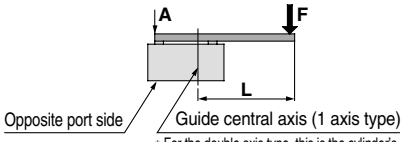
Table Deflection Amount

Displacement of Table due to Pitch Moment Load



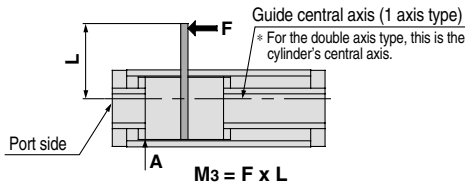
$M_1 = F \times L$

Displacement of Table due to Roll Moment Load



$M_2 = F \times L$

Displacement of Table due to Yaw Moment Load



$M_3 = F \times L$

REAHT25,32

Note) Deflection when a moment other than the above is applied can be specified by extending the lines in the graphs above.

Vertical Operation

When using in vertical operation, prevention of workpiece dropping due to breaking of the magnetic coupling should be considered. The allowable load mass and maximum operating pressure should be as shown in the table below. When the cylinder is mounted vertically or sidelong, sliders may move downwards due to the self-weight or workpiece mass. If an accurate stopping position is required at the stroke end or the middle-stroke, use an external stopper to secure accurate positioning.

Model	Allowable load mass **Wv** (kg)	Maximum operating pressure **Pv** (MPa)
REAH10	2.7	0.55
REAH15	7.0	0.65
REAH20	11.0	0.65
REAH25	18.5	0.65
REAHT25	18.5	0.65
REAHT32	30.0	0.65

Intermediate Stop

The cushion effect (smooth start-up, soft stop) exists only before the stroke end in the stroke ranges indicated in the table below.
The cushion effect (smooth start-up, soft stop) cannot be obtained in an intermediate stop or a return from an intermediate stop using an external stopper, etc.

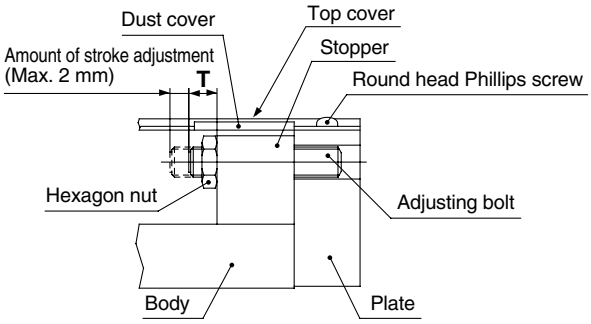
Cushion Stroke

Model	Stroke (mm)
REAH10	20
REAH15	25
REAH20	30
REAH25	30
REAHT25	30
REAHT32	30

Stroke Adjustment

The adjusting bolt is adjusted to the optimum position for smooth acceleration and deceleration at the time of shipment, and should be operated at the full stroke. When stroke adjustment is necessary, the maximum amount of adjustment on one side is 2 mm. (Do not adjust more than 2 mm, as it will not be possible to obtain smooth acceleration and deceleration.)
Do not adjust based on the stopper's movement, as this can cause cylinder damage.

Stroke adjustment method
Loosen the round head Phillips screws, and remove the top covers and dust covers (4 pcs.). Then loosen the hexagon nut, and after performing the stroke adjustment from the plate side with a hexagon wrench, retighten and secure the hexagon nut.



Adjusting Bolt Position (at the time of shipment), Hexagon Nut Tightening Torque

Model	**T** (mm)	Tightening torque (N·m)
REAH10	7	1.67
REAH15	7	
REAH20	7	
REAH25	9	3.14
REAHT25	9	
REAHT32	9	

After adjusting the stroke, replace the top covers and dust covers. Tighten the round head Phillips screws for securing the top covers with a torque of 0.58 N·m.

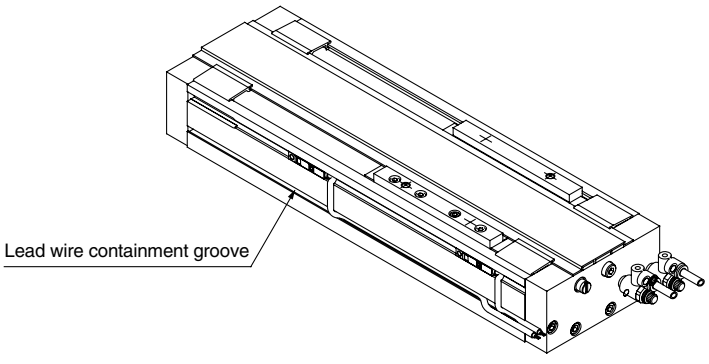
	REAH				REAHT	
	10	15	20	25	25	32
D-Z7□, Z8□	8	6	6	6	6	9
D-Y5□, Y6□, Y7□	6	5	5	5	5	6

∗ Since this is a guideline including hysteresis, not meant to be guaranteed. (assuming approximately ±30% dispersion)
There may be the case it will vary substantially depending on an ambient environment.

Auto Switch Lead Wire Containment Groove

On models REAH20 and REAH25 a groove is provided on the side of the body (one side only) to contain auto switch lead wires. This should be used for placement of wiring.



Other than the models listed in “How to Order”, the following auto switches are applicable. For detailed specifications, refer to page 1748.

Auto switch type	Model	Electrical entry (Fetching direction)	Features
Solid state	D-Y7G, Y7H	Grommet (In-line)	Normally closed

∗ For solid state auto switches, auto switches with a pre-wired connector are also available.
Refer to pages 1784 and 1785 for details.

Series REAH
Specific Product Precautions

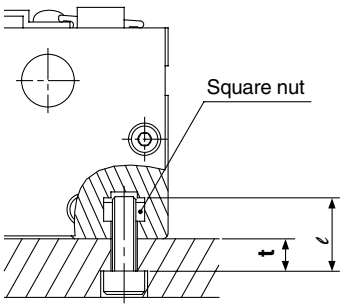
Be sure to read before handling. Refer to front matters 42 and 43 for Safety Instructions and pages 3 to 11 for Actuator and Auto Switch Precautions.

Mounting

⚠ Caution

1. **The interior is protected to a certain extent by the top cover, however, when performing maintenance, etc., take care not to cause scratches or other damage to the cylinder tube, slide table or linear guide by striking them or placing objects on them.**
   Cylinder bores are manufactured to precise tolerances, so that even a slight deformation may cause faulty operation.
2. **Because the slider is supported by precision bearings, take care not to apply strong impacts or excessive moments to the table when loading a workpiece.**
3. **Mounting of the cylinder body**
   The body is mounted using the square nuts, which are included, in the two T-slots on the bottom of the body. Refer to the table below for mounting bolt dimensions and tightening torque.

Model		REAH10	REAH15	REAH20	REAH25	REAHT25	REAHT32
Bolt dimensions	Thread size	M4 x 0.7	M5 x 0.8		M6 x 1.0		M8 x 1.25
	Dimension t	ℓ-7	ℓ-8		ℓ-9		ℓ-12
Tightening torque	N·m	1.37	2.65		4.4		13.2



Operation

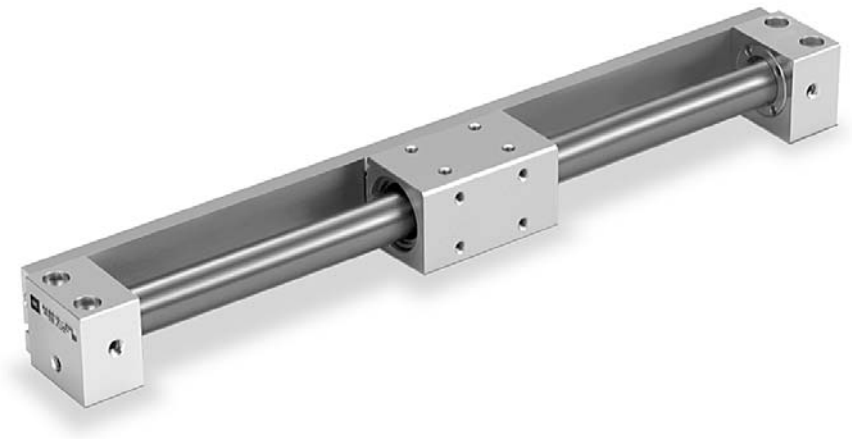
⚠ Caution

1. **The unit can be used with a direct load within the allowable range, but when connecting to a load which has an external guide mechanism, careful alignment is necessary**.
   Since variation of the shaft center increases as the stroke becomes longer, a connection method should be devised which allows for this displacement.
2. **Since the guide is adjusted at the time of shipment, unintentional movement of the adjustment setting should be avoided**.
3. **Please contact SMC before operating in an environment where there will be contact with cutting chips, dust (paper debris, lint, etc.) or cutting oil (gas oil, water, warm water, etc.)**.
4. **Do not operate with the magnetic coupling out of position.**
   In case the magnetic coupling is out of position, push the external slider back into the correct position by hand at the end of the stroke (or correct the piston slider with air pressure).

Direct Mount Type

Series *REBR*

ø15, ø25, ø32



Model Selection 1

Fn: Allowable driving force (N)
MD: Maximum allowable moment when connection fitting, etc., is directly loaded (N·m)
Pv: Maximum operating pressure for vertical operation (MPa)
WBmax: Maximum load mass when loaded directly on the body (kg)
Wv: Allowable load mass for vertical operation (kg)

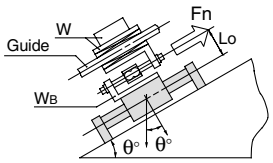
Operating Conditions

- **W:** Load mass (kg)
- **WB:** Connection fitting mass (kg)
- **μ:** Guide's coefficient of friction
- **Lo:** Distance from cylinder shaft center to workpiece point of application (cm)
- **L1:** Distance from the cylinder shaft center to the center of the gravity of connection fitting, etc. (mm)
- Presence of switches
- **P:** Operating pressure (MPa)
- **U:** Maximum speed (mm/s)
- Stroke (mm)
- Mode of operation (horizontal, inclined, vertical)

Mode of operation

Horizontal operation | Inclined operation | Vertical operation

Review of load mass and operating pressure



Inclined operation

First tentative bore size determination
$\varnothing D \geq 1.6 \times \sqrt{\frac{F_1}{P}}$

First tentative bore size determination
$\varnothing D \geq 1.6 \times \sqrt{\frac{F_2}{P}}$

First tentative bore size determination
$\varnothing D \geq 1.6 \times \sqrt{\frac{F_3}{P}}$

Allowable Driving Force (Fn) (n = 1, 2, 3)

Horizontal	$F_1 = \mu \times (W + W_B) \times 9.8$
Inclined	$F_2 = (W + W_B) \times 9.8 \times (\mu \cos\theta + \sin\theta)$
Vertical	$F_3 = (W + W_B) \times 9.8 \times (\mu + 1)$

Refer to the allowable driving force table for (Fn) of data (A).

$W + W_B \leq W_V$, $P \leq P_V$ | Determination of allowable load mass & pressure | $W + W_B > W_V$, $P > P_V$

(For vertical operation, refer to page 998.)

$W_B > W_{Bmax}$ Review of connection fitting

Determination of connection fitting mass (WB)

(For maximum load mass when loaded directly on the body, refer to page 998.)

$W_B \leq W_{Bmax}$

(For "Standard Stroke", refer to page 1001.)

Review of switches and stroke

Presence of switch rail — Yes → Presence of switch — Yes → Determination of stroke with switch — NG

None | None | OK

(Refer to data (A) on page 997.)

Second tentative determination of bore size using the graph of allowable driving force (Fn) and distance from cylinder shaft center (Lo)

Presence of external guide system — Yes

None

Note 2) $W_B \times L_1 > M_D$

(For body non-rotating accuracy and maximum allowable moment, refer to page 999.)

Determination of rotational moment

$W_B \times L_1 \leq M_D$

(For body non-rotating accuracy and maximum allowable moment, refer to page 999.)

(Refer to data (B) on page 997.)

Third tentative determination of bore size from the graph of maximum speed (U) and load mass (W).

(Bore size is the largest of 3 tentative determinations.)

Bore size determination

Note 2) NG — Determination of allowable stroke — OK

Note 1)

Consider made-to-order products, depending on an operating condition.

(Refer to page 1001.)

Model selected

Note 1) Made-to-order products should be considered, too, depending on an operating environment, etc.
Note 2) An external guide system should be installed when it is used beyond specifications.

Model Selection 2

Caution on Design 1

Selection Method

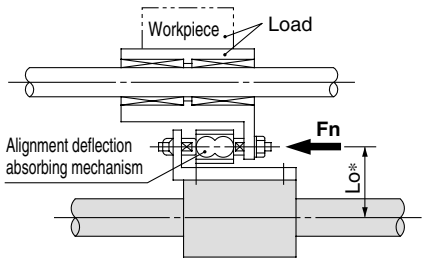
<Data (A): Distance from Cylinder Shaft Center ———Allowable Driving Capacity>

Selection Procedures

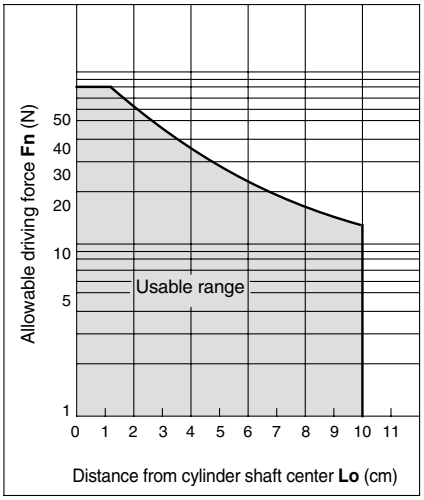
① Find the drive resisting force **Fn** (N) when moving the load horizontally.

② Find the distance **Lo** (cm) from the point of the load where driving force is applied, to the center of the cylinder shaft.

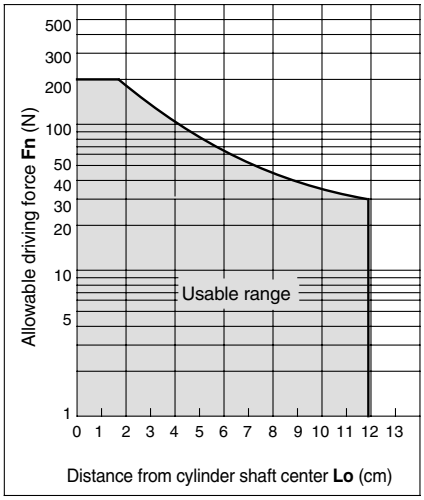
③ Select a bore size from **Lo** and **Fn** in Data A.



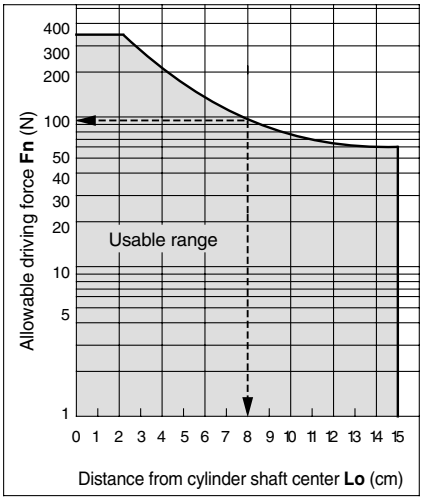
ø15



ø25



ø32

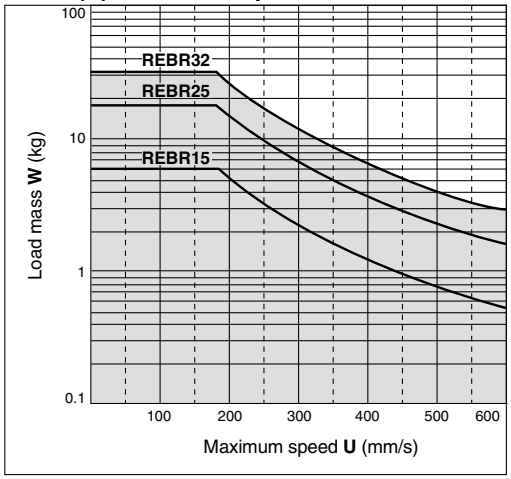


Selection Example

Given a load drive resisting force of **Fn** = 100 (N) and a distance from the cylinder shaft center to the load application point of **Lo** = 8 cm, find the intersection point by extending upward from the horizontal axis of data (A) where the distance from the shaft center is 8 cm, and then extending to the side, find the allowable driving force on the vertical axis. Models suitable to satisfy the requirement of 100 (N) are **REBR32**.

* Distance from cylinder shaft center, Lo, is the moment working point between the cylinder and the load.

<Data (B): Maximum Speed ———Load mass Chart>

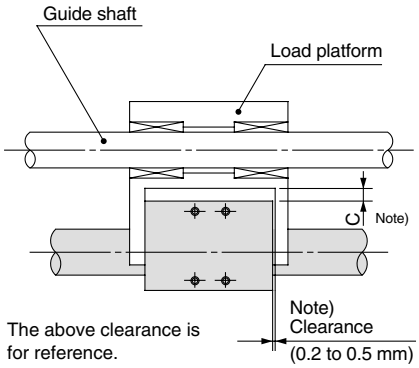


Model Selection 3

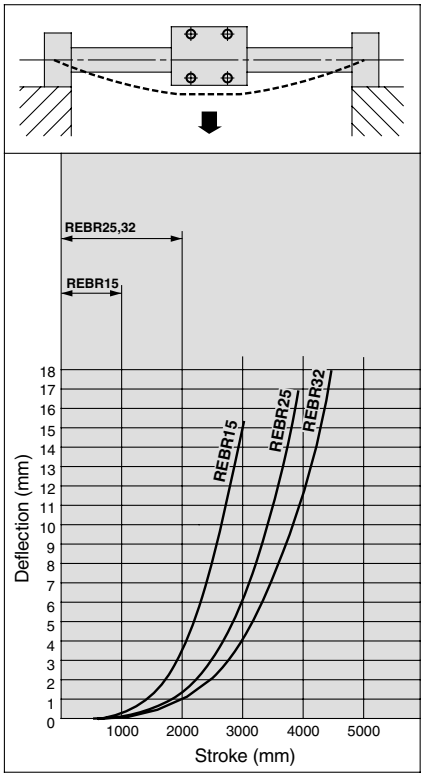
Caution on Design 2

Cylinder Self-weight Deflection

When the cylinder is mounted horizontally, deflection appears due to its own weight as shown in the data, and the longer the stroke, the greater the amount of variation in the shaft centers. Therefore, a connection method should be considered which allows for this variation as shown in the drawing.



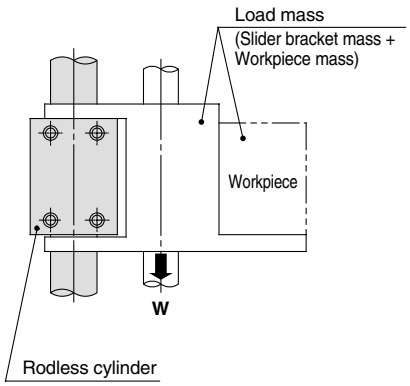
Note) Referring to the self-weight deflection in the graph below, provide clearance so that the cylinder does not touch the mounting surface or the load section, and is able to operate smoothly within the minimum operating pressure range for a full stroke.



∗ The above deflection data indicate values when the external slider has moved to the middle of the stroke.

Vertical Operation

The load should be guided by a ball type bearing (LM guide, etc.). If a slide bearing is used, sliding resistance will increase due to the load mass and moment, and this can cause malfunction.
When the cylinder is mounted vertically or sidelong, sliders may move downwards due to the self-weight or workpiece mass. If an accurate stopping position is required at the stroke end or the middle-stroke, use an external stopper to secure accurate positioning.



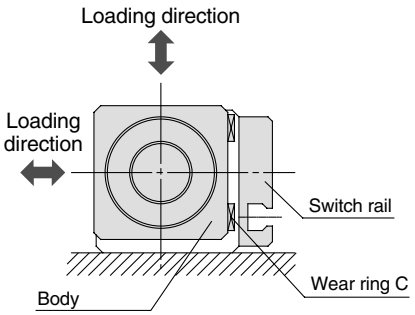
Bore size (mm)	Model	Allowable load mass **Wv** (kg)	Maximum operating pressure **Pv** (MPa)
15	**REBR15**	7.0	0.65
25	**REBR25**	18.5	0.65
32	**REBR32**	30.0	0.65

Note) Use caution, since the magnetic coupling may be dislocated if it is used over the maximum operating pressure.

Maximum Load Mass when Loaded Directly on Body

When the load is applied directly to the body, it should be no greater than the maximum values shown in the table below.

Model	Maximum load mass **WB**max (kg)
REBR15	1.0
REBR25	1.2
REBR32	1.5



Model Selection 4

Caution on Design 3

Intermediate Stop

The cushion effect (smooth start-up, soft stop) exists only before the stroke end in the stroke ranges indicated in the table below.
The cushion effect (smooth start-up, soft stop) cannot be obtained in an intermediate stop or return from an intermediate stop using an external stopper, etc.

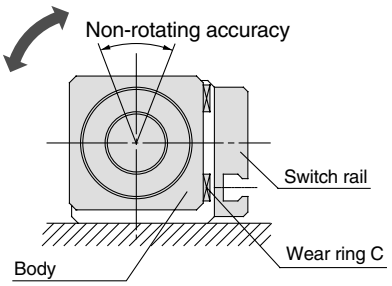
Cushion Stroke

Model	Stroke (mm)
REBR15	25
REBR25	30
REBR32	30

Body Non-rotating Accuracy and Max. Allowable Moment (With switch rail) (Reference values)

Reference values for non-rotating accuracy and maximum allowable moment at stroke end are indicated below.

Bore size (mm)	Non-rotating accuracy (°)	Maximum allowable moment M_D (N·m)	Note 2) Allowable stroke (mm)
15	4.5	0.15	200
25	3.7	0.25	300
32	3.1	0.40	400



Note 1) Avoid operations where rotational torque (moment) is applied. In such a case, the use of an external guide is recommended.
Note 2) The above reference values will be satisfied within the allowable stroke ranges. However, caution is necessary because as the stroke becomes longer the inclination (rotation angle) within the stroke can be expected to increase.
Note 3) When a load is applied directly to the body, the loaded mass should be no greater than the allowable load masss on page 998.

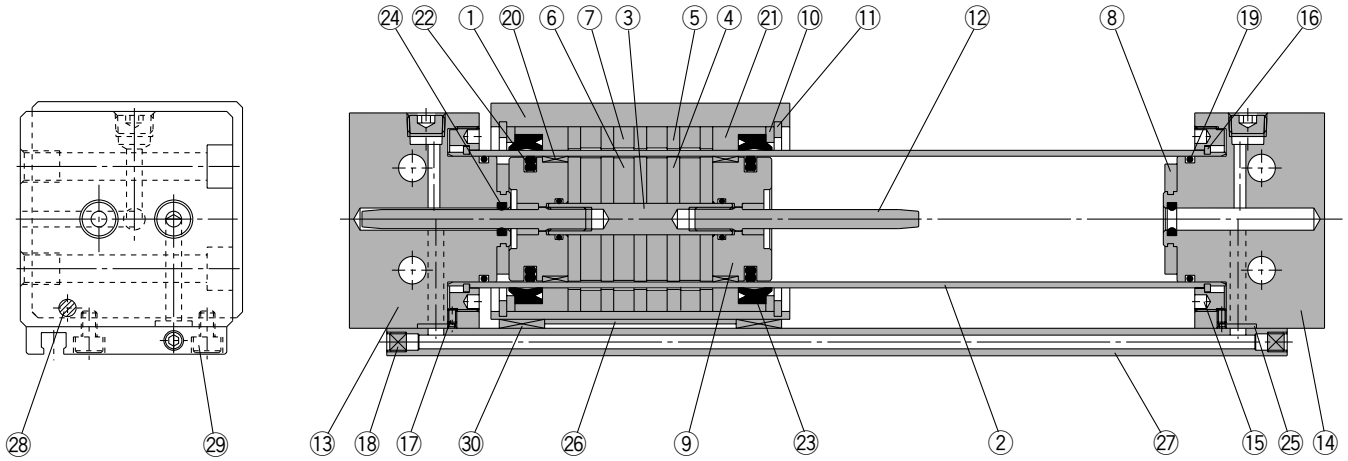
(kg)

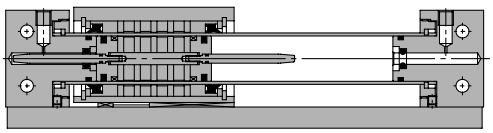
Item	Bore size (mm)	15	25	32
Basic mass (for 0 st)	**REBR□** (with switch rail)	0.277	0.660	1.27
	REBR□-□N (without switch rail)	0.230	0.580	1.15
Additional mass per each 50 mm of stroke (when equipped with switch rail)		0.045	0.083	0.113
Additional mass per each 50 mm of stroke (when not equipped with switch rail)		0.020	0.050	0.070

Calculation: (Example) **REBR25-500** (with switch rail)
- Basic mass ..... 0.660 (kg)
- Additional mass ..... 0.083 (kg/50 st)
- Cylinder stroke ..... 500 (st)

0.660 + 0.083 x 500 ÷ 50 = 1.49 kg

Construction: ø15, ø25, ø32





REBR15

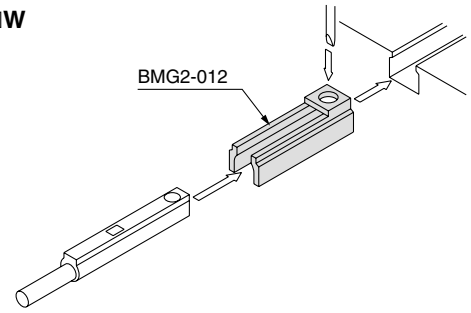
D-A9□/M9□/M9□W



Other than the models listed in “How to Order”, the following auto switches are applicable.
For detailed specifications, refer to pages 1719 to 1827.

Auto switch type	Model	Electrical entry (Fetching direction)	Features	Applicable bore size
Reed	D-Z73, Z76	Grommet (In-line)	—	ø25, ø32
	D-Z80		Without indicator light	
Solid state	D-Y59A, Y59B, Y7P	Grommet (In-line)	—	
	D-Y7NW, Y7PW, Y7BW		Diagnostic indication (2-color indication)	

∗ For solid state auto switches, auto switches with a pre-wired connector are also available. Refer to pages 1784 and 1785 for details.
∗ Normally closed (NC = b contact) solid state auto switches (D-F9G/F9H/Y7G/Y7H types) are also available. Refer to pages 1746 and 1748 for details.

Series REBR
Specific Product Precautions

Be sure to read before handling.
Refer to front matters 42 and 43 for Safety Instructions and pages 3 to 11 for Actuator and Auto Switch Precautions.

Mounting

⚠ Caution

1. Take care to avoid nicks or other damage on the outside surface of the cylinder tube.
This can lead to a damage of the scraper and the wear ring, which in turn can cause malfunction.

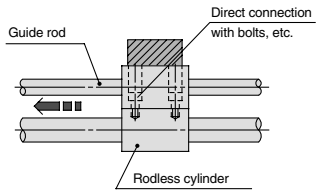
2. Use caution to the rotation of the external slider.
Rotation should be controlled by connecting it to another shaft (linear guide, etc.).

3. Do not operate with the magnetic coupling out of position.
If the magnetic coupling is out of position, push the external slider by hand (or the piston slider with air pressure) back to the proper position at the stroke end.

4. The cylinder is mounted with bolts through the mounting holes in the end covers. Be sure they are tightened securely.

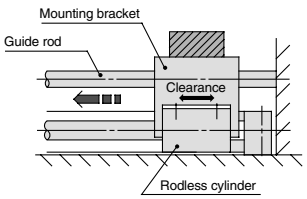
5. Be sure that both end covers are secured to the mounting surface before operating the cylinder.
Avoid operation with the external slider secured to the surface.

6. Do not apply a lateral load to the external slider.
When a load is mounted directly to the cylinder, variations in the alignment of each shaft center cannot be offset, which results in the generation of a lateral load that can cause malfunction. The cylinder should be operated using a connection method which allows for shaft alignment variations and deflection due to the cylinder's own mass. A drawing of a recommended mounting is shown in Fig. (2).



Variations in the load and cylinder shaft alignment cannot be offset and may result in a malfunction.

Fig. (1) Incorrect mounting



Shaft alignment variations are offset by providing clearance between the mounting bracket and cylinder. Moreover, the mounting bracket is extended above the cylinder shaft center, so that the cylinder is not subjected to moment.

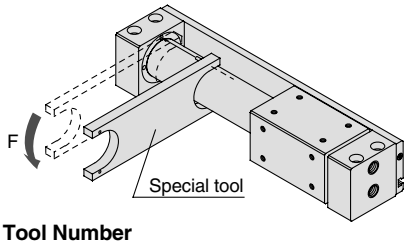
Fig. (2) Recommended mounting

7. Use caution regarding the allowable load mass when operating in a vertical direction.
The allowable load mass when operating in a vertical direction (reference values on page 998) is determined by the model selection method. However, if a load greater than the allowable value is applied, the magnetic coupling may break and there is a possibility of dropping the load. When using this type of application, please contact SMC regarding the operating conditions (pressure, load, speed, stroke, frequency, etc.).

Disassembly and Maintenance

⚠ Caution

1. Special tools are necessary for disassembly.



Special Tool Number

Part no.	Applicable bore size (mm)
CYRZ-V	15
CYRZ-W	25, 32

Linear Guide Type Single Axis/Double Axes

Series REBH/REBHT

Single Axis: ø15, ø25
Double Axes: ø25, ø32

REBHT

REBH

Model Selection 1

Pv: Maximum operating pressure for vertical operation (MPa)
Wv: Allowable load mass for vertical operation (kg)
α: Load factor

$$\Sigma\alpha = \frac{\text{Load mass (W)}}{\text{Max. load mass (Wmax)}} + \frac{\text{Static moment (M)}}{\text{Allowable static moment (Mmax)}} + \frac{\text{Dynamic moment (Me)}}{\text{Allowable dynamic moment (Memax)}}$$

Operating Conditions

- W: Load mass (kg)
- U: Maximum speed (mm/s)
- P: Operating pressure (MPa)
- Stroke (mm)
- Position of workpiece center of gravity (m)
- Mode of operation (horizontal, inclined, vertical)

Mode of operation

Horizontal operation

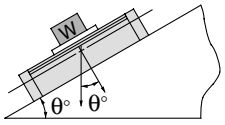
First tentative bore size determination

$$\varnothing D \geq 1.6 \times \sqrt{\frac{W}{P}}$$

Inclined operation

First tentative bore size determination

$$\varnothing D \geq 5.0 \times \sqrt{\frac{0.1 \times W\cos\theta + W\sin\theta}{P}}$$



Inclined operation

Vertical operation

First tentative bore size determination

$$\varnothing D \geq 5.0 \times \sqrt{\frac{0.1 \times W + W}{P}}$$

Determination of allowable load mass & pressure

W > Wv
P > Pv

W ≤ Wv
P ≤ Pv

(For vertical operation, refer to page 1012.)

Review of load mass and operating pressure

(Refer to page 1009.)

Determination of load factor ($\Sigma\alpha$)

$\Sigma\alpha > 1$

Review of operating conditions

$$\Sigma\alpha = \frac{\text{Load mass (W)}}{\text{Max. load mass (Wmax)}} + \frac{\text{Static moment (M)}}{\text{Allowable static moment (Mmax)}} + \frac{\text{Dynamic moment (Me)}}{\text{Allowable dynamic moment (Memax)}}$$

$\Sigma\alpha \leq 1$

(Refer to data (B) on page 1010.)

Second tentative determination of bore size from the graph of maximum speed (U) and load mass (W)

Bore size determination (The larger bore size is selected from two tentative determinations.)

Note)
Consider made-to-order products, depending on an operating condition.

Note) Made-to-order products should be considered, too, depending on an operating environment, etc.

(Refer to page 1015.)

Model selected

Model Selection 2

Caution on Design 1

The load mass allowable moment differs depending on the workpiece mounting method, cylinder mounting orientation and piston speed. In making a determination of usability, do not allow the sum ($\Sigma\alpha n$) of the load factors (αn) for each mass and moment to exceed "1".

$$\Sigma\alpha n = \frac{\text{Load mass (W)}}{\text{Maximum load mass (Wmax)}} + \frac{\text{Static moment (M)}}{\text{Allowable static moment (Mmax)}} + \frac{\text{Dynamic moment (Me)}}{\text{Allowable dynamic moment (Memax)}} \leq 1$$

Caution on Design 2

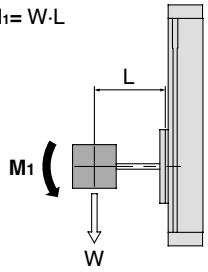
<Graph (3)>

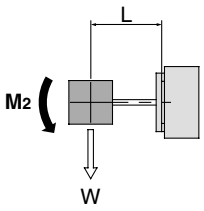
Static Moment

Moment generated by the workpiece mass even when the cylinder is stopped

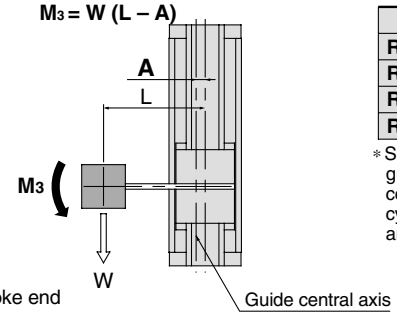
■ **Pitch moment**
$M_1 = W \cdot L$



■ **Roll moment**
$M_2 = W \cdot L$



■ **Yaw moment**
$M_3 = W (L - A)$



(mm)

Model	A
REBH15	17.5
REBH25	23.5
REBHT25	0*
REBHT32	0*

* Since there are 2 guides, the guides' central axis and the cylinder's central axis are the same.

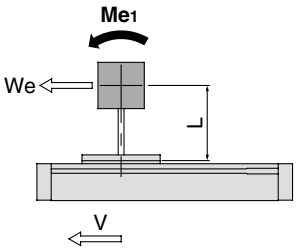
Dynamic Moment

Moment generated by the load equivalent to impact at the stroke end

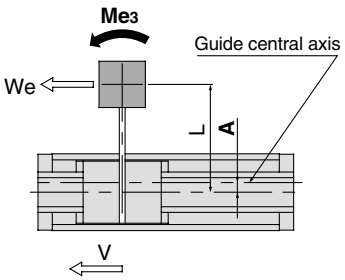
$We = 5 \times 10^{-3} \cdot W \cdot g \cdot U$

We : Load equivalent to impact [N]
W : Load mass [kg]
U : Maximum speed [mm/s]
g : Gravitational acceleration (9.8 m/s²)

■ **Pitch moment**
$Me_1 = 1/3 \cdot We \cdot L$



■ **Yaw moment**
$Me_3 = 1/3 \cdot We (L - A)$

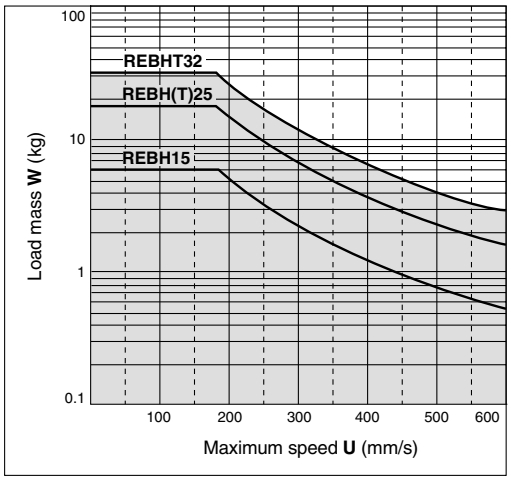


(mm)

Model	A
REBH15	17.5
REBH25	23.5
REBHT25	0*
REBHT32	0*

* Since there are 2 guides, the guides' central axis and the cylinder's central axis are the same.

<Data (B): Maximum speed——Load Mass Chart>



Model Selection 3

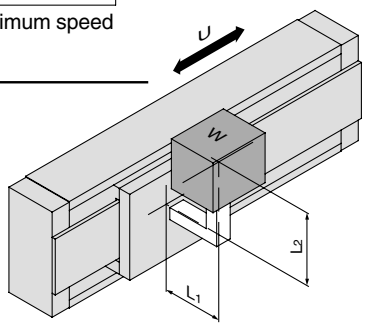
Selection Calculation

The selection calculation finds the load factors (αn) of the items below, where the total ($\Sigma\alpha n$) does not exceed 1.

$$\Sigma\alpha n = \alpha_1 + \alpha_2 + \alpha_3 \leq 1$$

Item	Load factor αn	Note
1. Max. load mass	**α_1 = W/Wmax**	Review W. Wmax is the maximum load mass.
2. Static moment	**α_2 = M/Mmax**	Review M_1, M_2, M_3. Mmax is the allowable moment.
3. Dynamic moment	**α_3 = Me/Memax**	Review Me_1, Me_3. Memax is the allowable moment.

U: Maximum speed



Calculation Example

Operating Conditions

Cylinder: REBH15
Mounting: Horizontal wall mounting style
Maximum speed: **U** = 500 [mm/s]
Load mass: **W** = 1 [kg] (excluding mass of arm section)
L_1 = 200 [mm]
L_2 = 200 [mm]

Item	Load factor αn	Note
1. Maximum load mass 	**α_1 = W/Wmax** = 1/3 **= 0.111** **= 0.333**	Examine W. (For Wmax, find the value in <Graph (1)> when U = 500 mm/s.)
2. Static moment 	**M_2 = W·L_1** = 10 · 0.2 = 2 [N·m] **α_2 = M_2/M_2max** = 2/16 **= 0.125** **W** = 1 [kg] = 10 [N]	Examine M_2. Since M_1 & M_3 are not generated, investigation is unnecessary.
3. Dynamic moment 	**We** = 5 x 10^{-3} ·**W·g·U** = 5 x 10^{-3} · 1 · 9.8 · 500 = 25 [N] **Me_3** = 1/3·**We (L_2 – A)** = 1/3 · 25 · 0.182 = 1.52 [N·m] **α_3 = Me_3/Me_3max** = 1.52/6 **= 0.25**	Examine Me_3. (For Memax, find the value in <Graph (2)> when U = 500 mm/s.)
	**Me_1** = 1/3·**We·L_1** = 1/3 · 25 · 0.2 = 1.6 [N·m] **α_4 = Me_1 /Me_1max** = 1.6/6 **= 0.27**	Examine Me_1. (For Memax, find the value in <Graph (2)> when U = 500 mm/s.)

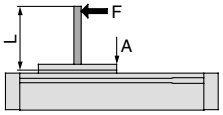
$\Sigma\alpha n = \alpha_1 + \alpha_2 + \alpha_3 + \alpha_4$
= 0.333 + 0.125 + 0.25 + 0.27
= 0.978 ≤ 1
And it is possible to use.

Model Selection 4

Caution on Design 2

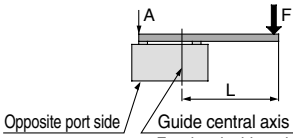
Table Deflection Amount

Displacement of Table due to Pitch Moment Load



$M_1 = F \times L$

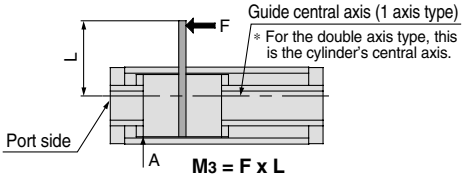
Displacement of Table due to Roll Moment Load



∗ For the double axis type, this is the cylinder's central axis.

$M_2 = F \times L$

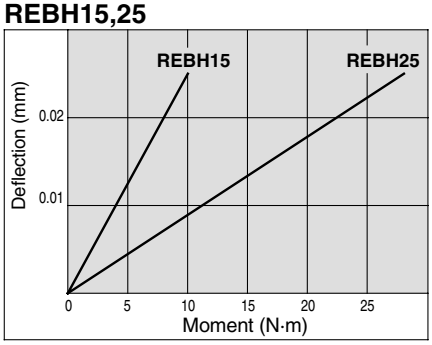
Displacement of Table due to Yaw Moment Load



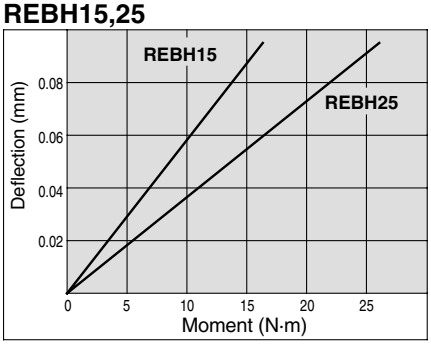
$M_3 = F \times L$

Note) Deflection: Displacement of section A when force acts on section F

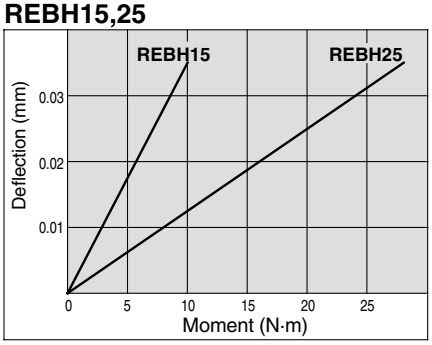
REBH15,25



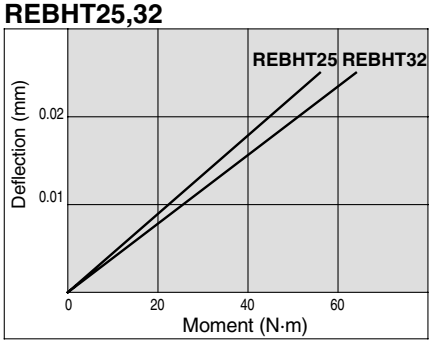
REBH15,25



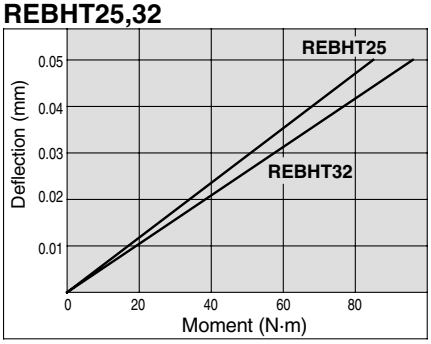
REBH15,25



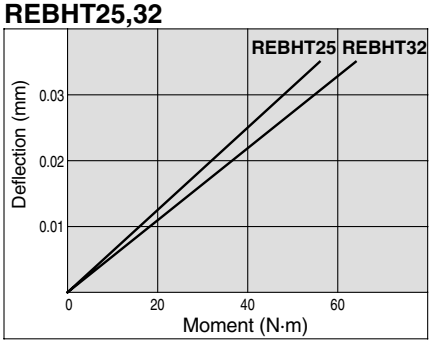
REBHT25,32



REBHT25,32



REBHT25,32



Note) Deflection when a moment other than the above is applied can be specified by extending the lines in the graphs above.

Vertical Operation

When using in vertical operation, prevention of workpiece dropping due to breaking of the magnetic coupling should be considered. The allowable load mass and maximum operating pressure should be as shown in the table below. When the cylinder is mounted vertically or sidelong, sliders may move downwards due to the self-weight or workpiece mass. If an accurate stopping position is required at the stroke end or the middle-stroke, use an external stopper to secure accurate positioning.

Model	Allowable load mass **Wv** (kg)	Maximum operating pressure **Pv** (MPa)
REBH15	7.0	0.65
REBH25	18.5	0.65
REBHT25	18.5	0.65
REBHT32	30.0	0.65

Intermediate Stop

The cushion effect (smooth start-up, soft stop) exists only before the stroke end in the stroke ranges indicated in the table below.
The cushion effect (smooth start-up, soft stop) cannot be obtained in an intermediate stop or a return from an intermediate stop using an external stopper, etc.

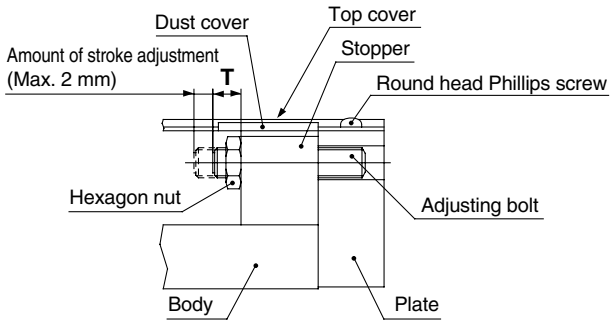
Cushion Stroke

Model	Stroke (mm)
REBH15	25
REBH25	30
REBHT25	30
REBHT32	30

Stroke Adjustment

The adjusting bolt is adjusted to the optimum position for smooth acceleration and deceleration at the time of shipment, and should be operated at the full stroke. When stroke adjustment is necessary, the maximum amount of adjustment on one side is 2 mm. (Do not adjust more than 2 mm, as it will not be possible to obtain smooth acceleration and deceleration.)
Do not adjust based on the stopper's movement, as this can cause cylinder damage.

Stroke adjustment method
Loosen the round head Phillips screws, and remove the top covers and dust covers (4 pcs.). Then loosen the hexagon nut, and after performing the stroke adjustment from the plate side with a hexagon wrench, retighten and secure the hexagon nut.



Adjusting Bolt Position (at the time of shipment), Hexagon Nut Tightening Torque

Model	**T** (mm)	Tightening torque (N•m)
REBH15	7	1.67
REBH25	9	3.14
REBHT25	9	
REBHT32	9	

After adjusting the stroke, replace the top covers and dust covers.
Tighten the round head Phillips screws for securing the top covers with a torque of 0.58 N·m.

4	**Shaft**	Stainless steel	
5	**Piston side yoke**	Rolled steel plate	Zinc chromated
6	**External slider side yoke**	Rolled steel plate	Zinc chromated
7	**Magnet A**	—	
8	**Magnet B**	—	
9	**Bumper**	Urethane rubber	Except REBH15
10	**Piston**	Aluminum alloy	Chromated
11	**Spacer**	Rolled steel plate	Nickel plated
12	**Space ring**	Aluminum alloy	Chromated
13	**Slide table**	Aluminum alloy	Hard anodized
14	**Side plate A**	Aluminum alloy	Hard anodized
15	**Side plate B**	Aluminum alloy	Hard anodized
16	**Cushion ring**	Stainless steel	Compound electroless nickel plated
17	**Internal stopper**	Aluminum alloy	Anodized
18	**Plate A**	Aluminum alloy	Hard anodized

Component Parts

No.	Description	Material	Note
19	**Plate B**	Aluminum alloy	Hard anodized
20	**Stopper**	Aluminum alloy	Anodized
21	**Adjusting bolt**	Chromium molybdenum steel	Nickel plated
22	**Hexagon nut**	Carbon steel	Nickel plated
23	**Linear guide**		
24	**Top cover**	Aluminum alloy	Hard anodized
25	**Dust cover**	Special resin	
26	**Magnet (for auto switch)**	—	
27	**Parallel pin**	Carbon steel	Nickel plated
28	**Square nut for body mounting**	Carbon steel	Nickel plated (Accessory)
29	**Wear ring A**	Special resin	
30	**Wear ring B**	Special resin	
31	**Piston seal**	NBR	
32	**Scraper**	NBR	
33	**O-ring**	NBR	
34	**O-ring**	NBR	
35	**Cushion seal**	NBR	

Note) Square nut for body mounting ㉘: 4 pieces

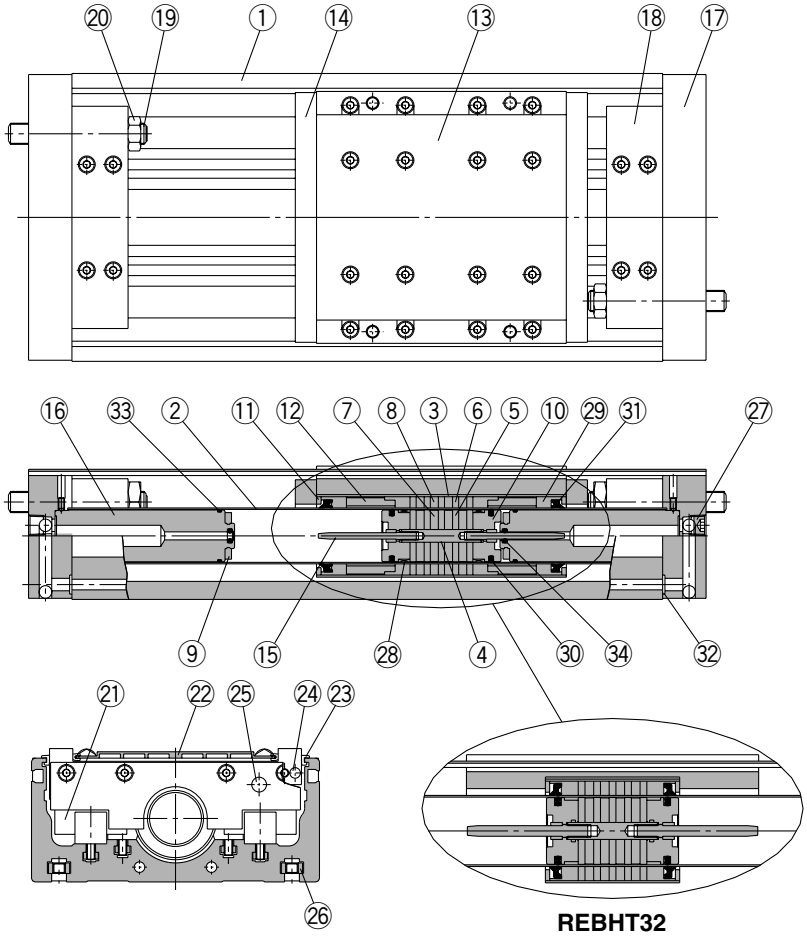
Replacement Parts/Seal Kit

Bore size (mm)	Kit no.	Contents
15	REBH15-PS	Set of nos. above ㉙, ㉚, ㉛, ㉜, ㉝, ㉞, ㉟
25	REBH25-PS	

Note) Cushion seal ㉟ may be difficult to be replaced.
∗ Seal kit includes a grease pack (10 g).
Order with the following part number when only the grease pack is needed.
Grease pack part no.: GR-S-010 (10 g)

Construction: ø25, ø32

Double axis type: REBHT



REBHT32

Component Parts

No.	Description	Material	Note
1	**Body**	Aluminum alloy	Hard anodized
2	**Cylinder tube**	Stainless steel

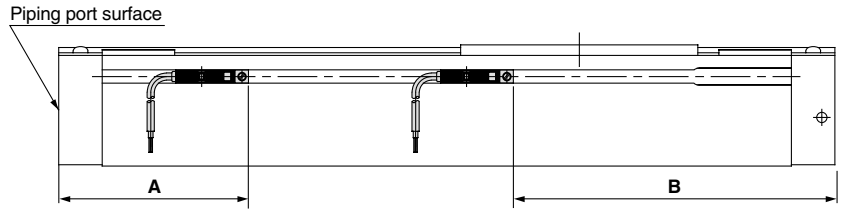
Proper Auto Switch Mounting Position (Detection at stroke end)



Proper Auto Switch Mounting Position

Auto switch model / Cylinder model	A dimension			B dimension		
	D-Z7□ D-Z80	D-Y7□W D-Y7□WV	D-Y5□ D-Y6□ D-Y7P D-Y7PV	D-Z7□ D-Z80	D-Y7□W D-Y7□WV	D-Y5□ D-Y6□ D-Y7P D-Y7PV
REBH15	72			122		
REBH25	86			164		
REBHT25	86			164		
REBHT32	82			183		

Note) Adjust the auto switch after confirming the operating conditions in the actual setting.

Operating Range

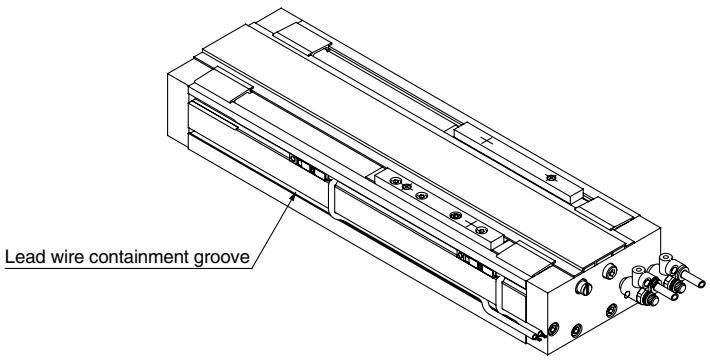
(mm)

Auto switch model	Bore size (mm)			
	REBH		REBHT	
	15	25	25	32
D-Z7□/Z8□	6	6	6	9
D-Y5□/Y6□/Y7□	5	5	5	6

∗ Since this is a guideline including hysteresis, not meant to be guaranteed. (assuming approximately ±30% dispersion)
There may be the case it will vary substantially depending on an ambient environment.

Auto Switch Lead Wire Containment Groove

On model REBH25 a groove is provided on the side of the body (one side only) to contain auto switch lead wires. This should be used for placement of wiring.



Other than the models listed in “How to Order”, the following auto switches are applicable.
For detailed specifications, refer to pages 1719 to 1827.

* Normally closed (NC = b contact) solid state auto switches (D- Y7G/Y7H types) are also available. Refer to page 1748 for details.

Series REBH
Specific Product Precautions

Be sure to read before handling.
Refer to front matters 42 and 43 for Safety Instructions and pages 3 to 11 for Actuator and Auto Switch Precautions.

Mounting

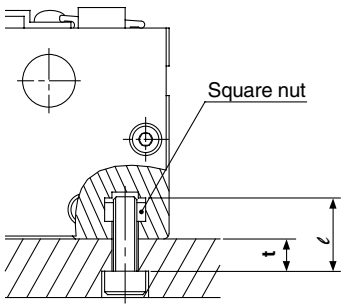
⚠ Caution

1. The interior is protected to a certain extent by the top cover, however, when performing maintenance, etc., take care not to cause scratches or other damage to the cylinder tube, slide table or linear guide by striking them or placing objects on them.
Cylinder bores are manufactured to precise tolerances, so that even a slight deformation may cause faulty operation.

2. Because the slider is supported by precision bearings, take care not to apply strong impacts or excessive moments to the table when loading a workpiece.

3. Mounting of the cylinder body.
The body is mounted using the square nuts, which are included, in the two T-slots on the bottom of the body. Refer to the table below for mounting bolt dimensions and tightening torque.

Model		REBH15	REBH25	REBHT25	REBHT32
Bolt dimensions	Thread size	M5 x 0.8	M6 x 1.0		M8 x 1.25
	Dimension **t**	ℓ-8	ℓ-9		ℓ-12
Tightening torque	N·m	2.65	4.4		13.2



Operation

⚠ Caution

1. The unit can be used with a direct load within the allowable range, but when connecting to a load which has an external guide mechanism, careful alignment is necessary.
Since variation of the shaft center increases as the stroke becomes longer, a connection method should be devised which allows for this displacement.

2. Since the guide is adjusted at the time of shipment, unintentional movement of the adjustment setting should be avoided.

3. Please contact SMC before operating in an environment where there will be contact with cutting chips, dust (paper debris, lint, etc.) or cutting oil (gas oil, water, warm water, etc.).

4. Do not operate with the magnetic coupling out of position.
In case the magnetic coupling is out of position, push the external slider back into the correct position by hand at the end of the stroke (or correct the piston slider with air pressure).
